# 1 Introduction

## 1.1 Systems requirements

- Computer with Intel Skylake processor or better
- Intel HD530 graphic card with performance that matches or is better than the resolution of the camera
- Windows 7 (or newer) operating system
- Network access
- Web browser:
  - Internet Explorer version 11 (or newer)
  - Mozilla Firefox
- Application software, for example, Video Security Client, Bosch Video Client, BVMS, or Project Assistant app.
- DirectX 11
- MPEG-ActiveX 6.33 (or newer) [required to see, in your browser, live images from the camera]
- Configuration Manager 6.20 (or newer)

## 1.2 Establishing the connection

The unit must have a valid IP address to operate on your network and a compatible subnet mask.

By default, DHCP is pre-set at the factory to **On plus Link-Local** so a DHCP server assigns an IP address or, if no DHCP server is available, a link-local address (auto-IP) is assigned within the range 169.254.1.0 to 169.254.254.255.

You can use IP Helper or Configuration Manager to find the IP address. Download the software from <http://downloadstore.boschsecurity.com>.

1. Start the Web browser.
2. Enter the IP address of the unit as the URL.
3. During initial installation, confirm any security questions that appear.

If a RADIUS server is used for network access control (802.1x authentication), you must configure the device before the device can communicate with the network.

To configure the device, connect it directly to a computer using a network cable and then set the service-level password.

**Note:**

If you cannot connect, the unit may have reached its maximum number of connections.

Depending on the device and network configuration, each unit can have up to 50 web browser connections, or up to 100 connections via Bosch Video Client or Bosch Video Management System.

## 1.3 Password protection in camera

The device is password-protected. The first time that any user accesses the device, the device will prompt the user to set a password at the service level.

The camera requires a strong password. Follow the prompts in the dialog box, which specifies what is required. The system measures the strength of the password that you enter.

When you use Configuration Manager to access your device for the first time, you must set the initial password of the device in Configuration Manager. The Users section (General > Unit Access > Users) displays the message, "Before you can use this device you have to secure it with an initial password."

**Note:** After you set the initial password, a "lock" icon appears next to the device name in the **Devices** list in Configuration Manager.

You can also launch the device webpage directly. In the device webpage, an initial password page appears, displaying input fields and a password strength gauge.

Enter the user name ("**service**") and a password in the appropriate fields. Refer to the section **User Management** for more information.

After a service-level password is set for the device, the device displays a dialog box that prompts users to enter the user name ("**service**") and the service-level password every time that they access the device.

1. Fill in the fields **User name** and **Password**.
2. Click **OK**. If the password is correct, the desired page appears.

## 2 System overview

When a connection is established, the **Live** page is initially displayed. The application bar displays the following icons:

	<b>Live</b>	Click this icon to view the live video stream.
	<b>Playback</b>	Click this icon to play back recorded sequences. This link is only visible if a storage medium has been configured for recording. (With VRM recording, this option is not active.)
	<b>Configuration</b>	Click this icon to configure the device.
	<b>Dashboard</b>	Click this icon to see detailed system information.
	<b>Links</b>	Click this icon to navigate to the Bosch download store.
		Click this icon to get context-sensitive help for the page you are browsing.

### 2.1 Live page

The **Live** page is used to display the live video stream and control the unit.

### 2.2 Configuration

The **Configuration** page is used to configure the unit and the application interface.

#### Making Changes

Each configuration screen shows the current settings. You can change the settings by entering new values or by selecting a predefined value from a list field.

Not every page has a **Set** button. Changes to pages without a **Set** button are set immediately. If a page does show a **Set** button, you must click the **Set** button for a change to take effect.

#### Notice!

Save each change with the associated **Set** button.

Clicking the **Set** button saves the settings only in the current field. Changes in any other fields are ignored.

Some changes only take effect after the unit is rebooted. In this case, the **Set** button changes to **Set and Reboot**.

1. Make the desired changes.
2. Click the **Set and Reboot** button. The camera reboots and the changed settings are activated.

All settings are backed up in camera memory so they are not lost even if the power fails. The exception is the time settings, which are lost after 1 hour without power if no central time server is selected.

### 2.3 Playback

The **Playback** page is used for playing back recorded sequences.

## 2.4 Dashboard

The **Dashboard** page is used to display detailed information about the device.

The **Dashboard** is only visible in the application bar if the **Show 'Dashboard'** option is enabled by a service-level user in the **Configuration -> Web Interface -> Appearance** page.

## 3 Operation via the browser

### 3.1 Live page

#### 3.1.1 Connection

##### Stream 1

Select this option to display stream 1 of the camera.

##### Stream 2

Select this option to display stream 2 of the camera.

##### M-JPEG

Select this option to display the M-JPEG stream of the camera.

#### 3.1.2

### PTZ

#### Pan and tilt controls

- To tilt the camera up: Click and hold the up arrow.
- To tilt the camera down: Click and hold the down arrow.
- To pan the camera left: Click and hold the left arrow.
- To pan the camera right: Click and hold the right arrow.
- To pan and tilt the camera at the same time (variable pan/tilt): Click and drag the center area (that resembles a point stick or a trackball on a computer keyboard) around the PTZ control in the direction that you want to move the camera.

#### Zoom

Click the + button to zoom in.

Click the - button to zoom out.

#### Iris

Click  (**Iris close**) to close the iris.

Click  (**Iris open**) to open the iris.

#### Focus

Click  to focus near.

Click  to focus far.

#### 3.1.3

### Pre-positions

The camera displays **Pre-position 1** through **Pre-position 6**. Select the appropriate pre-position to view the video image for that pre-position/scene. In the lower left of the video image, the OSD displays the Camera number (title), the Pre-position number, and the Pre-position number stored.

Below the list of pre-positions/scenes is a drop-down list showing the stored pre-positions/scenes.

Select the appropriate pre-position (1 through 6). Click  to store the pre-position.

**Note:** If the pre-position is already stored, a dialog box displays the message, “**Overwrite current pre-position?**” Click **OK** to overwrite, or click **Cancel** to cancel the operation.

Click  to display the selected pre-position in the video image.

### 3.1.4

#### AUX Control

With the tab **AUX Control** you can enter pre-programmed keyboard control commands. These commands are composed of a command number plus the appropriate function key (**Show pre-position**, **Set pre-position**, **AUX on**, or **AUX off**). A valid combination either issues a command to the device or displays an on-screen menu.

(Refer to the “AUX Commands” section of the manual for a list of all AUX commands for your camera.)

##### Show pre-position

Click this button to display a pre-position.

##### Set pre-position

Click this button to set a pre-position.

##### AUX on

Click this button to activate an AUX command.

##### AUX off

Click this button to deactivate an AUX command.

### 3.1.5

#### Digital I/O

(only for cameras with alarm connections)

Depending on the configuration of the unit, the alarm input and the output are displayed next to the image. Expand the Digital I/O group if necessary.

The alarm symbol is for information and indicates the status of an alarm input:

- The symbol lights when the input alarm is active.

The alarm output allows the operation of an external device (for example, a light or a door opener).

- To activate the output, click the checkmark symbol.
  - The symbol lights when the output is activated.

##### Input 1

This parameter identifies the first alarm input.

##### Input 2

This parameter identifies the second alarm input.

##### Output 1

Click the checkmark icon to enable the output. The checkmark becomes green.

**Note:** You can change the name of an alarm input in **Configuration > Interfaces > Alarm Inputs > Input 1 (or Input 2) > Name**.

You can change the name of an alarm output in **Configuration > Interfaces > Alarm Outputs > Output name**.

### 3.1.6

#### Special Functions

##### Tour A / Tour B

Click one of these buttons to start the continuous playback of a recorded (guard) tour. A recorded tour saves all manual camera movements made during the recording, including its rate of pan, tilt and zoom speeds, and other lens setting changes.

To stop a tour, click a directional control in the View Control tab.

##### Find home

Click this button to trigger the camera to seek its home position. The OSD displays the message, “OSD: Finding Home Position.”

##### Focus

Click this button to activate the Auto Focus One Push mode on the camera.

The OSD displays the message, “Auto Focus: ONE PUSH.”

### Nightmode

Click this button to activate/deactivate night mode for the camera. After a few seconds, the camera switches modes.

### Custom tour

Click this button to view (in continuous playback) a custom tour that was previously configured.

To stop a tour, click a directional control in the PTZ section of the page.

## 3.1.7 Recording status

The hard drive icon  below the live camera image changes during an automatic recording. The icon lights up and displays a moving graphic to indicate a running recording. If no recording is taking place, a static icon is displayed.

## 3.1.8 Saving snapshots

Individual images from the displayed live video stream can be saved locally in JPEG format on the computer's hard drive. The storage location depends on the configuration of the camera.

– Click the photo camera icon  to save a single image.

## 3.1.9 Recording live video

Video sequences from the displayed live video stream can be saved locally on the computer's hard drive. The sequences are recorded at the resolution specified in the encoder configuration. The storage location depends on the configuration of the camera.

1. Click the recording icon  to record video sequences.
  - Saving begins immediately. The red dot on the icon indicates that a recording is in progress.
2. Click the recording icon again to stop recording.

## 3.1.10 Full-screen display

Click the full-screen icon  to view the selected stream in full-screen mode; press **Esc** on the keyboard to return to the normal viewing window.

## 3.1.11 Audio communication

Audio can be sent and received via the **Live** page if the unit and the computer support audio.

1. Press and hold the F12 key on the keyboard to send an audio signal to the unit.
2. Release the key to stop sending audio.

All connected users receive audio signals sent from the unit but only the user who first pressed the F12 key can send audio signals; others must wait for the first user to release the key.

## 3.1.12 Storage, CPU and network status

When accessing the unit with a browser, the local storage, processor and network status icons are shown in the upper right of the window.

When a local storage card is available, the memory card icon changes color (green, orange or red) to indicate the local storage activity. If you hover over this icon with the mouse the storage activity is shown as a percentage.

If you hover over the middle icon, the CPU load is shown.

If you hover over the right-hand icon, the network load is shown.

This information can help with problem solving or when fine tuning the unit. For example:

- if the storage activity is too high, change the recording profile,
- if the CPU load is too big, change the VCA settings,
- if the network load is too big, change the encoder profile to reduce bitrate.

### 3.1.13

#### Status icons

Various overlays in the video image provide important status information. The overlays provide the following information:

##### Decoding error

The frame might show artifacts due to decoding errors.

##### Alarm flag

Indicates that an alarm has occurred.

##### Communication error

A communication error, such as a connection failure to the storage medium, a protocol violation or a timeout, is indicated by this icon.

##### Gap

Indicates a gap in the recorded video.

##### Watermark valid

The watermark set on the media item is valid. The color of the check mark changes according to the video authentication method that has been selected.

##### Watermark invalid

Indicates that the watermark is not valid.

##### Motion alarm

Indicates that a motion alarm has occurred.

##### Storage discovery

Indicates that recorded video is being retrieved.

## 3.2

### Playback via browser

Click  **Playback** in the application bar to view, search or export recordings. This link is only visible if a direct iSCSI or memory card has been configured for recording. (With VRM recording this option is not active.)

The panel on the left has four groups:

- **Connection**
- **Search**
- **Export**
- **Track list**

### 3.2.1 Selecting the recording stream

On the left side of the browser, expand the **Connection** group if necessary.

To view a recording stream:

1. Click the **Recording** drop-down arrow to see the options.
2. Select recording stream 1 or 2.

### 3.2.2 Searching for recorded video

On the left side of the browser, expand the **Search** group if necessary.

1. To limit the search to a particular time range, enter the date and times for the start and stop points.
2. Select an option from the drop-down box to define a search parameter.
3. Click **Start Search**.
4. The results are shown.
5. Click a result to play it back.
6. Click **Back** to define a new search.

### 3.2.3 Exporting recorded video

On the left side of the browser, expand the **Export** group if necessary.

1. Select a track in the track list or in the search results (or click on the timeline below the video window and drag the buttons to mark the sequence you want to export).
2. The start and stop date and time are filled-in for the selected track. If required, change the times.
3. In the **Time lapse** drop-down box, select the original or a condensed speed.
4. In the **Location** drop-down box, select a target.
5. Click **Export** to save the video track.

**Note:**

The target server address is set on the **Network / Accounts** page.

### 3.2.4 Controlling playback

The time bar below the video image allows quick orientation. The time interval associated with the sequence is displayed in the bar in gray. Arrows indicate the position of the image currently being played back within the sequence.

The time bar offers various options for navigation in and between sequences.

- If required, click in the bar at the point in time at which the playback should begin.
- Change the time interval displayed by clicking the plus or minus icons or use the mouse scroll wheel. The display can span a range from six months to one minute.
- Click the alarm jump buttons to go from one alarm event to the next or to the previous one. Red bars indicate the points in time where alarms were triggered.

**Controls**

Control playback by means of the buttons below the video image.

The buttons have the following functions:

- Start/Pause playback
- Select the playback (forward or backward) speed using the speed regulator
- Step forward or backward frame-by-frame when paused (small arrows)

## 4 General

### 4.1 Identification

#### Device name

Enter a unique, unambiguous name for the device (for example, the installation location of the device). This name should be easy to identify in a list of devices in your system. The device name is used for the remote identification of a unit, such as in the event of an alarm.

Do not use any special characters, for example **&**, in the name. Special characters are not supported by the system's internal management.

#### Device ID

Enter a unique identifier for the device. This ID is additional identification for the device.

#### Host naming

Enter a host name.

#### Initiator extension

Add text to an initiator name to make identification easier in large iSCSI systems. This text is added to the initiator name, separated from it by a full stop. (You can see the initiator name in the System Overview page.)

### 4.2 User Management

The section **Allowed authentication modes** provides information about the authentication modes set in the camera. A checkmark appears in the checkbox to the left of the mode if the mode is set. If the mode is not set, the phrase, "No certificate installed" appears to the right of the mode name.

#### Password

This field indicates if a password is set for the camera.

#### Certificate

A check mark in this check box indicates that at least one certificate is loaded onto the camera. If no certificates are loaded, then "No certificate installed" appears to the right of the text.

The Escrypt certificate is a root certificate for Bosch Security Systems that proves that the device meets the following criteria:

- It originates from a Bosch factory that is a secure environment.
- It has not been tampered with.

Escrypt is a Bosch company and Certificate Authority (CA).

#### Active directory server (ADFS)

A check mark in this check box indicates that the camera uses an active directory server. If the camera does not use ADFS, then "No certificate installed" appears to the right of the text.

#### Password management

A password prevents unauthorized access to the device. You can use different authorization levels to limit access.

Proper password protection is only guaranteed when all higher authorization levels are also protected with a password. Therefore, you must always start from the highest authorization level when assigning passwords.

You can define and change a password for each authorization level if you are logged into the "service" user account.

The device has three authorization levels: service, user, and live.

- service is the highest authorization level. Entering the correct password gives access to all the functions and allows all configuration settings to be changed.

- user is the middle authorization level. At this level you can operate the device, play back recordings, and also control camera, for example, but you cannot change the configuration.
- live is the lowest authorization level. At this level you can only view the live video image and switch between the different live image displays.

#### To edit a password

To edit a password, click the pencil icon to the right of the column **Type** for the appropriate **User name**.

#### To create a new user

To create a new user, click **Add**.

In the box **User**, fill in the fields. For Group, select the appropriate authorization level. For **Type**, select either **Password** (for a new password) or **Certificate** (for a certificate that the new user is authorized to use).

**Note:** Use a maximum of 19 characters. Do not use special characters.

#### Confirm password

In each case, enter the new password a second time to eliminate typing mistakes.

#### Notice!

A new password is only saved when you click the **Set** button. You should therefore click the **Set** button immediately after entering and confirming a password.

## 4.3

### Date/Time

#### Date format

Select the required date format from the dropdown menu.

#### Device date/Device time

#### Notice!

Make sure that recording is stopped before synchronizing to the PC.

If there are multiple devices operating in your system or network, it is important to synchronize their internal clocks. For example, it is only possible to identify and correctly evaluate simultaneous recordings when all units are operating on the same time.

1. Enter the current date. Since the unit time is controlled by the internal clock, there is no need to enter the day of the week - it is added automatically.
2. Enter the current time or click the **Sync to PC** button to copy your computer's system time to the camera.

**Note:** It is important that the date/time is correct for recording. An incorrect date/time setting could prevent correct recording.

#### Device time zone

Select the time zone in which the system is located.

#### Daylight saving time

The internal clock can switch automatically between normal and daylight saving time (DST). The unit already contains the data for DST switch-overs for many years in advance. If the date, time and zone have been set up correctly, a DST table is automatically created.

If you decide to create alternative daylight saving time dates by editing the table, note that values occur in linked pairs (DST start and end dates).

First, check the time zone setting. If it is not correct, select the appropriate time zone and click **Set**.

1. Click **Details** to edit the DST table.
2. Select the region or the city which is closest to the system's location from the list box below the table.
3. Click **Generate** to fill the table with the preset values from the unit.
4. Click one of the entries in the table to make changes. The entry is highlighted.
5. Click **Delete** to remove the entry from the table.
6. Choose other values from the list boxes under the table, to change the selected entry. Changes are immediate.
7. If there are empty lines at the bottom of the table, for example after deletions, add new data by marking the row and selecting values from the list boxes.
8. When finished, click **OK** to save and activate the table.

#### Time server address

The camera can receive the time signal from time server using various time server protocols, and then use it to set the internal clock. The unit polls the time signal automatically once every minute.

Enter the IP address of a time server here.

You can choose to have the DHCP server give a time server date by selecting the **Overwrite by DHCP** option.

#### Time server type

Select the protocol that is supported by the selected time server.

- Select **Time protocol** if the server uses the protocol RFC 868.
- The **SNTP protocol** supports a high level of accuracy and is required for special applications and subsequent function extensions.
- Select **TLS protocol** if the server uses the RFC 5246 protocol.
- Select **Off** to disable the time server.

Click **Set** to apply the changes.

## 4.4 Display Stamping

Various overlays or “stamps” in the video image provide important supplementary information. These overlays can be enabled individually and are arranged on the image in a clear manner.

#### Camera name stamping

This field sets the position of the camera name overlay. It can be displayed at the **Top**, at the **Bottom** or at a position of your choice that you can then specify using the **Custom** option. Or it can be set to **Off** for no overlay information.

1. Select the desired option from the list.
2. If you select the **Custom** option, additional fields are displayed where you can specify the exact position (**Position (XY)**).
3. In the **Position (XY)** fields, enter the values for the desired position.

Optionally, tick the **Underlay with full-width black bar** box to place a black bar beneath the time stamp.

#### Logo

To place a logo on the image, select and upload an uncompressed .bmp file with a maximum size of 128x128 pixels and 256 colors to the camera. Its position on the image can then be selected.

### Logo position

Select the position for the logo on the OSD: **To the left of the name**, **To the right of the name**, or **Logo only**.

Select **Off** (the default value) to disable logo positioning.

### Time stamping

This field sets the position of the time overlay. It can be displayed at the **Top**, at the **Bottom** or at a position of your choice that you can then specify using the **Custom** option. Or it can be set to **Off** for no overlay information.

1. Select the desired option from the list.
2. If you select the **Custom** option, additional fields are displayed where you can specify the exact position (**Position (XY)**).
3. In the **Position (XY)** fields, enter the values for the desired position.

### Display milliseconds

If necessary, you can also display milliseconds. This information can be useful for recorded video images; however, it does increase the processor's computing time. Select **Off** if you do not need to display milliseconds.

### Live video indicator

Select **On** to display the **Live video indicator**, an icon that pulses on the OSD to show that the video stream is live.

Select **Off** to hide the **Live video indicator**.

### Alarm mode stamping

Select **On** to display a text message overlay in the image in the event of an alarm. It can be displayed at a position of your choice that you can then specify using the **Custom** option. Or it can be set to **Off** for no overlay information.

1. Select the desired option from the list.
2. If you select the **Custom** option, additional fields are displayed where you can specify the exact position (**Position (XY)**).
3. In the **Position (XY)** fields, enter the values for the desired position.

### Alarm message

Enter the message to be displayed in the image in the event of an alarm. The maximum text length is 31 characters.

### Title OSD

OSD titles can be displayed at a position of your choice.

Select **On** to display sector or pre-position title overlays continuously in the image.

Select **Momentary** to display sector or pre-position title overlays for a few seconds.

1. Select the desired option from the list.
2. Specify the exact position (**Position (XY)**).
3. In the **Position (XY)** fields, enter the values for the desired position.

Select **Off** to deactivate the display of overlay information.

### Camera OSD

Select **On** to momentarily display camera response information, such as Digital Zoom, Iris open/close, and Focus near/far overlays in the image. Select **Off** to display no information.

1. Select the desired option from the list.
2. Specify the exact position (**Position (XY)**).
3. In the **Position (XY)** fields, enter the values for the desired position.

### Title region

Select **On** to set or to edit the position of the title region on the OSD.

The fields **Position (XY)** and **(0...255)** appear.

1. In the field **Position (XY)**, specify the exact position. (The default is 10.)
2. In the field **(0...255)**, enter the position range. (The default is 176).

Select **Off** to hide the region from view.

#### Telemetry region

Select **On** to set or to edit the position of the telemetry information (azimuth and elevation (pan/tilt position)) and the zoom factor on the OSD. Refer to the section "PTZ Settings, page 36" to set the pan and tilt limits.

The fields **Position (XY)** and **(0...255)** appear.

1. In the field **Position (XY)**, specify the exact position. (The default is 10.)
2. In the field **(0...255)**, enter the position range. (The default is 176).

Select **Off** to hide the region from view.

#### Feedback region

Select **On** to set or to edit the position of system feedback messages (including message for camera settings such as focus, iris, and zoom level) on the OSD. Refer to the section "Lens Settings" to configure these settings.

The fields **Position (XY)** and **(0...255)** appear.

1. In the field **Position (XY)**, specify the exact position. (The default is 10.)
2. In the field **(0...255)**, enter the position range. (The default is 176).

Select **Off** to hide the region from view.

#### Transparent background

Check this box to make transparent the stamp background on the image.

#### Stamping size

Select the desired font size of the overlays on the OSD: **Normal** or **Large**.

#### Text color

Select the color for the alarm message to be displayed in.

#### Background color

Select the background color for the alarm message to be displayed in.

If you have enabled the **Transparent background** option, the background color is not displayed in the OSD.

#### Video authentication

Select from the **Video authentication** drop-down box a method for verifying the integrity of the video.

If you select **Watermarking**, all images are marked with an icon. The icon indicates if the sequence (live or saved) has been manipulated.

If you want to add a digital signature to the transmitted video images to ensure their integrity, select one of the cryptographic algorithms for this signature.

#### Signature interval [s]

For certain **Video authentication** modes, enter the interval (in seconds) between insertions of the digital signature.

## 4.5

### GB/T 28181

This page allows you to set the parameters for conformance to the GB/T 28181 national standard "Security and protection video monitoring network system for information transport, switch and control". This standard is specifically for China.

**Enable**

Select this checkbox to enable the system to use the other parameters on this page in accordance with the GB/T 28181 national standard.

**H.264 elementary stream**

Select this checkbox to select or to enable the H.264 elementary stream.

**Registration timeout**

Enter a value (in milliseconds) for the registration timeout. The default is 3600.

**Heartbeat timeout**

Enter the value (in seconds) for the heartbeat timeout. The default is 15.

**Server ID**

Enter the ID of the server.

**Server IP address**

Enter the server IP address.

**Server port**

Enter the number of the server port. The default is 0.

**Device ID**

Enter the ID of the device.

**Device port**

Enter the number of the device port. The default is 5060.

**Password**

Enter the appropriate password.

**Alarm device ID**

Enter the ID of the alarm device.

## 5 Web Interface

### 5.1 Appearance

You can adapt the appearance of the web interface and change the website language to meet your requirements.

GIF or JPEG images can be used to replace the company and device logos. The image can be stored on a web server (for example, <http://www.myhostname.com/images/logo.gif>).

Ensure that a connection to the web server is always available to display the image. The image files are not stored on the unit.

To restore the original graphics, delete the entries in the **Company logo** and **Device logo** fields.

#### Website language

Select the language for the user interface.

The default language is English. After selecting a different language, click the **Set** button. The page refreshes automatically. The GUI now displays field names and options as well as OSD messages in the selected language.

#### Company logo

To replace the company's logo in the top-right part of the window, enter the path to a suitable image in this field. The image file must be stored on a web server.

#### Device logo

To replace the device name in the top-left part of the window, enter the path to a suitable image in this field. The image file must be stored on a web server.

#### Notice!

If you want to use the original image again, delete the entries in the fields **Company logo** and **Device logo**.

#### Show VCA metadata

When video content analysis (VCA) is activated, additional information is displayed in the live video stream. With the MOTION+ analysis type, for example, the sensor fields in which motion is recorded are marked with yellow rectangles.

Using Essential Video Analytics or Intelligent Video Analytics, the outlines of detected objects are displayed in following colors:

- Red: Objects that generate an alarm event under the current settings appear on the camera image inside a red outline.
- Orange: An object that has triggered one alarm event but does not generate another appears inside an orange outline (example: object has crossed a line). During forensic search, an object that triggers an alarm event has an orange outline from the beginning.
- Yellow: Objects that are detected as moving but do not generate an alarm event under the current settings appear inside a yellow outline.

#### Show VCA trajectories

(Only for certain cameras)

The trajectories (motion lines of objects) from the video content analysis are displayed in the live video image if a corresponding analysis type is activated. The trajectory is shown as a green line following the object base point.

#### Show overlay icons

Select this check box to show overlay icons on the live video image.

### Show VCA items

Shows alarm fields, lines and routes configured for the video analytics in the following colors:

- Green: Fields, lines and routes used in a task are displayed in green. They can be edited but not deleted.
- Red: Fields, lines and routes currently in alarm mode are displayed in red.

### Latency mode

Select the required latency mode:

- **Low delay:** Default mode. Provides marginal buffering to display fluent video under normal network conditions.
- **Smooth video:** Allows the buffer to automatically adjust to cover network jitter, inducing higher latency.
- **Unbuffered:** Displays video as it is received by the decoder with minimum latency. Allows the video to jerk if there is network jitter.

### JPEG resolution

You can specify the size of the JPEG image on the **Live** page. Options are **Small, Medium, Large, 720p, 1080p**, and **“Best possible”** (default).

### JPEG interval

You can specify the interval at which the individual images should be generated for the M-JPEG image on the **Live** page.

### JPEG quality

You can specify the quality at which the JPEG images appear on the **Live** page.

## 5.2

### LIVE Functions

On this page you can adapt the functions on the **LIVE** page to your requirements. You can choose from a variety of different options for displaying information and controls.

1. Check the box for the items that are to be made available on the **LIVE** page. The selected items are indicated by a check mark.
2. Check whether the required functions are available on the **LIVE** page.

#### Transmit audio

You can only select this option if audio transmission is actually switched on (see Audio). The audio signals are sent in a separate data stream parallel to the video data, and so increase the network load. The audio data are encoded according to G.711 and require an additional bandwidth of approx. 80 kbps per connection in each direction.

#### Show 'AUX Control'

Here you can specify whether the **Live** page displays the section **Show 'AUX Control'**.

#### Show 'Special Functions'

#### Video file format

Select a file format for the live page display. The MP4 format does not include metadata.

## 6 Camera

### 6.1 Installer Menu

#### Base frame rate

Select the base frame rate for the camera.

**Note:** Shutter times, frame rates, and the analog output (if present) are affected by this value.

#### Notice!

Changing the field **Sensor mode**

A change to the parameter in the field **Sensor mode** requires approximately 10-20 seconds to complete. During this time, no changes can be made. The cameo image freezes.

#### Image rotation

To invert the live video image (because the camera is mounted in inverted orientation), select 180°.

If the camera is mounted upright, select 0°.

#### Mirror image

Select **On** to output a mirror image of the camera picture.

**Note:** Privacy masks are not supported in mirror image mode.

#### Coding standard

Select the encoding mode, H.264 or H.265 .

#### Reboot device

Click **Reboot** to restart the camera.

#### Factory defaults

Click **Defaults** to restore the factory defaults for the camera. A confirmation screen appears. Allow several seconds for the camera to optimize the picture after a reset.

**Note:** Clicking this button also clears the service-level password. Operators must reset the password before doing anything else.

### 6.2 Scene Mode

A scene mode is a collection of image parameters that are set in the camera when that particular mode is selected (installer menu settings are excluded). Several pre-defined modes are available for typical scenarios. After a mode has been selected, additional changes can be made through the user interface.

Customize the mode, if necessary, for the specific requirements of the site by selecting different values for the fields below.

#### Current mode

Select the mode you wish to use from the drop-down menu.

##### – Standard

This mode is optimized for most standard scenes both indoor and outdoor.

##### – Sensitivity boost

This mode provides maximum sensitivity in low light scenes by using longer exposure times, resulting in bright images even in extreme low light.

##### – Fast movement

This mode is used for monitoring fast moving objects like cars in traffic scenes. Motion artifacts are minimized and the image is optimized for a sharp and detailed picture in color and monochrome.

##### – Vibrant

This mode provides a more vivid image with increased contrast, sharpness, and saturation.

- **Color Only (Traffic)**

In this mode, the camera does not switch to monochrome mode at low light levels. The mode is optimized to minimize motion artifacts and to capture the color of vehicles/pedestrians and traffic lights, even at night, for scenarios such as city surveillance and traffic monitoring.

- **Custom mode #1**

If necessary, select a custom mode.

- **Custom mode #2**

If necessary, select a second custom mode.

**Mode ID**

The name of the selected mode is displayed.

**Copy mode to**

Select the mode from the drop-down menu to which you wish to copy the active mode.

**Restore mode defaults**

Click **Restore Mode Defaults** to restore the factory default modes. Confirm your decision.

## 6.2.1

### Picture Settings

#### 5.2.1.1 Color

**White Balance**

Adjusts the color settings to maintain the quality of the white areas of the image.

**Red Gain**

The red gain adjustment offsets the factory white point alignment (reducing red introduces more cyan).

**Blue Gain**

The blue gain adjustment offsets the factory white point alignment (reducing blue introduces more yellow). It is only necessary to change the white point offset for special scene conditions.

**Sodium red level**

Adjust the level of red for sodium vapor lighting with the slider from 0 to 255.

**Sodium blue level**

Adjust the level of blue for sodium vapor lighting with the slider from 0 to 255.

Note: The fields **Sodium red level** and **Sodium blue level** appear only when the value in the field **White balance** is “Sodium lamp auto” or “Sodium lamp.”

**Saturation**

Select the percentage of light or color in the video image. The range of options is from 60% to 200%; the default is 100%.

**Color hue**

Select the degree of color in the video image. The range of options is from -14° to 14°; the default is 0°.

#### 5.2.1.2 Exposure and gain control

**Gain control**

Adjusts the automatic gain control (AGC).

- **AGC** (default): Automatically adjusts the gain to the lowest possible value needed to maintain a good picture.
- **Fixed**: no enhancement. This setting disables the Max. Gain Level option.

**Fixed Gain**

Use the slide to select the desired number for fixed gain. The default is 2.

To set the **Maximum gain level**, select **Low**, **Medium** or **High** from the drop-down box.

#### **AE-response speed**

Select the speed of the response of auto exposure. Options are Super slow, Slow, Medium (default), Fast.

#### **Shutter Mode**

- **Fixed:** The shutter mode is fixed to a selectable shutter speed.
- **Automatic exposure:** increases camera sensitivity by increasing the integration time on the camera. This is accomplished by integrating the signal from a number of consecutive video frames to reduce signal noise.  
If you select this option, the camera disables **Shutter** automatically.

#### **Shutter**

Adjusts the electronic shutter speed (AES). Controls the time period for which light is gathered by the collecting device. The default setting is 1x (60 Hz: 1/30, 50 Hz: 1/25)

#### **Maximum automatic exposure**

Use this field to limit the integration time when Frame Integration is active. The range of options is from 1/4 to 1/30 (default).

#### **Default shutter limit**

The camera tries to hold this shutter value as long as sufficient ambient light is available in the scene.

The range of options is from **1/60** to **1/10000**. The default value is **1/120** for all modes except **Motion** (default **1/500**).

#### **5.2.1.3 Day/Night**

##### **Backlight compensation**

Select **Off** to switch off backlight compensation.

Select **On** to capture details in high-contrast and extremely bright-dark conditions.

##### **Night mode**

Selects night mode (B/W) to enhance lighting in low light scenes. Select from the following options:

- **Monochrome:** Forces the camera to stay in Night Mode and transmit monochrome images.
- **Color:** The camera does not switch to Night Mode regardless of ambient light conditions.
- **Auto** (default): The camera switches out of Night Mode after the ambient light level reaches a pre-defined threshold.

##### **Night mode threshold**

Adjusts the level of light at which the camera automatically switches out of night mode (B/W) operation. Select a value between 10 and 55 (in increments of 5; default 30). The lower the value, the earlier the camera will switch to color mode.

## **6.2.2**

### **Enhance**

#### **High dynamic range**

Select On to activate wide dynamic range, which improves image reproduction in extreme high-contrast scenes.

Select Off to deactivate the feature.

- **Auto** - Stabilization activates automatically when the camera detects vibration greater than the set threshold.

#### **Sharpness mode**

Select the appropriate sharpness mode. Options are **Manual** and **Auto**.

### Sharpness level

This field is active when **Sharpness mode** is set to **Manual**.

Adjust the level of sharpness of the video image (from 1 to 15) using the slider.

Adjustments to the **Sharpness level** appear on the OSD.

### Intelligent Defog

With the Intelligent Defog mode feature, visibility can be improved significantly when viewing foggy or other low-contrast scenes.

Select *Auto* to activate the Intelligent Defog feature automatically as needed.

Select *Off* to disable the feature.

### Intelligent Defog intensity

Select the amount of intensity for the defog feature.

**Note:** This field appears only when the option in Intelligent Defog is "**On**" or "**Auto**."

### Noise reduction

By default, this option is **On**.

Noise reduction **On** enables temporal noise reduction, which reduces random video noise in the picture by averaging pixels across time if the difference between them is below a threshold. **Off** disables temporal noise reduction.

### Intelligent Dynamic Noise Reduction

Select **On** to activate intelligent Dynamic Noise Reduction (DNR) which reduces noise based on motion and light levels.

## 6.2.3

### Scene Mode Scheduler

The scene mode scheduler is used to determine which scene mode should be used during the day and which scene mode should be used during the night.

1. Select the mode you wish to use during the day from **Marked range** drop-down box.
2. Select the mode you wish to use during the night from **Unmarked range** drop-down box.
3. Use the two slider buttons to set the **Time ranges**.

## 6.3

### Color

#### Brightness (0...255)

Adjust the brightness with the slider from 0 to 255.

#### Contrast (0...255)

Adjust the contrast with the slider from 0 to 255.

#### Saturation (0...255)

Adjust the color saturation with the slider from 0 to 255.

#### White balance

Select the appropriate white balance mode from the drop-down list.

- **Basic auto** mode allows the camera to continually adjust for optimal color reproduction using an average reflectance method. This is useful for indoor light sources and for colored LED light illumination.
- **Standard auto** mode allows the camera to continually adjust for optimal color reproduction in an environment with natural light sources.
- **Dominant color auto** mode takes into account any dominant color in the image (for example, the green of a football pitch or of a gaming table) and uses this information to obtain a well balanced color reproduction.
- In **Manual** mode the Red, Green, and Blue gain can be manually set to a desired position.

### Apply white balance

Click **Hold** to put ATW on hold and save the current color settings. The mode changes to manual.

The table below identifies the options available in the field **White balance** and the additional fields that appear depending on the options selected.

Option in field “White balance”	Additional Input field	Additional fields for configuration	NOTES
<b>Basic auto</b>	<b>RGB-weighted white balance</b>	<b>R-weight G-weight B-weight</b>	The 3 “-weight” fields appear only when the option in the field “ <b>RGB-weighted white balance</b> ” is <b>On</b> .
<b>Standard auto</b>	<b>RGB-weighted white balance</b>	<b>R-weight G-weight B-weight</b>	
<b>Sodium lamp auto</b>	<b>RGB-weighted white balance</b>	<b>R-weight G-weight B-weight</b>	
<b>Dominant color auto</b>	<b>RGB-weighted white balance</b>	<b>R-weight G-weight B-weight</b>	
<b>Manual</b>		<b>R-gain G-gain B-gain</b>	

### RGB-weighted white balance

In an auto mode, **RGB-weighted white balance** can be switched On or Off. When On, additional fine tuning of the automatic color reproduction can be made with the R, G and B weight sliders.

#### R-weight

When White balance is in an auto mode, and **RGB-weight white balance** is On, this field appears. Adjust the slide for red-gain weight (from -5-0 to +50, with 0 as the default). Reducing red introduces more cyan.

#### G-weight

When White balance is in an auto mode, and **RGB-weight white balance** is On, this field appears. Adjust the slide for green-gain weight (from -5-0 to +50, with 0 as the default). Reducing green introduces more magenta.

#### B-weight

When White balance is in an auto mode, and **RGB-weight white balance** is On, this field appears. Adjust the slide for blue-gain weight (from -5-0 to +50, with 0 as the default). Reducing blue introduces more yellow.

**R-gain**

In **Manual** white balance mode, adjust the red gain slider to offset the factory white point alignment (reducing red introduces more cyan).

**G-gain**

In **Manual** white balance mode, adjust the green gain slider to offset the factory white point alignment (reducing green introduces more magenta).

**B-gain**

In **Manual** white balance mode, adjust the blue gain slider to offset the factory white point alignment (reducing blue introduces more yellow).

## 6.4

### ALC

The saturation (av-pk) slider configures the ALC level so that it controls mainly on scene average level (slider position -15) or on scene peak level (slider position +15). Scene peak level is useful for capturing images that contain car headlights.

**Maximum gain [dB]**

Adjust the decibels of maximum gain with the slider. The range is 6 to 72.

**Exposure**

Select the appropriate exposure speed.

Select **Auto** to allow the camera to set the optimum shutter speed automatically. The camera tries to maintain the selected shutter speed as long as the light level of the scene permits.

Select **Fixed** to set a fixed shutter speed.

**Min. frame rate**

Select the minimum frame rate.

**Default shutter**

Select a default shutter speed. The default shutter improves the motion performance in auto exposure mode.

**Shutter time**

Select the amount of time for the shutter to remain open.

**Auto** - the camera switches the IR cut-off filter on and off depending on the scene illumination level.

**Monochrome** - the IR cut-off filter is removed, giving full IR sensitivity.

**Color** - the camera always produces a color signal regardless of light levels.

**Night-to-day switchover**

Adjust the slider to set the video level at which the camera in **Auto** mode switches from monochrome to color operation (-15 to +15).

A low (negative) value means that the camera switches to color at a lower light level. A high (positive) value means that the camera switches to color at a higher light level.

(The actual switch-over point might change automatically to avoid instable switching.)

**Iris Priority (slider)**

With this slider, you can adjust the iris opening to the specific requirements of the scene.

An open iris increases local sharpness.

A closed iris increases depth of field, which allows you to keep objects of interest in focus.

In scenes where a change of the iris opening affects the gain, closing the iris causes more video noise and increases bandwidth. Increased motion blur may also occur when the iris is more closed.

## 6.5 Enhance

### High dynamic range

Select On to activate wide dynamic range, which improves image reproduction in extreme high-contrast scenes.

Select Off to deactivate the feature.

- **Auto** - Stabilization activates automatically when the camera detects vibration greater than the set threshold.

### Sharpness mode

Select the appropriate sharpness mode. Options are **Manual** and **Auto**.

### Sharpness level

This field is active when **Sharpness mode** is set to **Manual**.

Adjust the level of sharpness of the video image (from 1 to 15) using the slider.

Adjustments to the **Sharpness level** appear on the OSD.

### Intelligent Defog

With the Intelligent Defog mode feature, visibility can be improved significantly when viewing foggy or other low-contrast scenes.

Select *Auto* to activate the Intelligent Defog feature automatically as needed.

Select *Off* to disable the feature.

### Intelligent Defog intensity

Select the amount of intensity for the defog feature.

**Note:** This field appears only when the option in Intelligent Defog is "**On**" or "**Auto**."

### Noise reduction

By default, this option is **On**.

Noise reduction On enables temporal noise reduction, which reduces random video noise in the picture by averaging pixels across time if the difference between them is below a threshold. Off disables temporal noise reduction.

### Intelligent Dynamic Noise Reduction

Select **On** to activate intelligent Dynamic Noise Reduction (DNR) which reduces noise based on motion and light levels.

## 6.6 Scene Mode Scheduler

The scene mode scheduler is used to determine which scene mode should be used during the day and which scene mode should be used during the night.

1. Select the mode you wish to use during the day from **Marked range** drop-down box.
2. Select the mode you wish to use during the night from **Unmarked range** drop-down box.
3. Use the two slider buttons to set the **Time ranges**.

## 6.7 Encoder Profile

For the video signal encoding, you can select a code algorithm and you can change the presets for the profiles.

You can adapt the video data transmission to the operating environment (for example network structure, bandwidth, data load). To this end, the camera simultaneously generates two data streams (Dual Streaming), which compression settings you can select individually, for example one setting for transmissions to the Internet and one for LAN connections.

Pre-programmed profiles are available, each giving priority to different perspectives.

You can change individual parameter values of a profile and you can also change the name. You can switch between profiles by clicking the appropriate tabs.

### Caution!

The profiles are rather complex. They include a large number of parameters that interact with one another, so it is generally best to use the default profiles.

Change the profiles only once you are fully familiar with all the configuration options.

**Note:** In the default setting, Stream 1 is transmitted for alarm connections and automatic connections.

### Notice!

All parameters combine to make up a profile and are dependent on one another. If you enter a setting that is outside the permitted range for a particular parameter, the nearest permitted value will be substituted when the settings are saved.

### Profile name

If required, enter a new name for the profile.

### Bit rate optimization

The bit rate optimization defines the optimization strength. These must be combined with the appropriate scene mode. The **Bit rate optimization** and **Maximum bit rate** work in a quality-driven mode. The encoder generates a bit rate up to the maximum setting if the scene requires it.

For maximum image quality, apply minimum bit rate reduction (**Maximum quality**). This will also greatly increase the file size. If maximum bit rate reduction is applied, the image will have less quality, but the file size decreases significantly (**Minimum bit rate**).

Select the necessary bit rate optimization setting:

- **Off:** bit rate optimization is disabled
- **Maximum quality**
- **High quality**
- **Medium**
- **Low bit rate**
- **Minimum bit rate**

### Averaging period

Select the appropriate averaging period as a means of stabilizing the long term bit rate.

### Target bit rate

To optimize use of the bandwidth in the network, limit the data rate for the device. The target data rate should be set according to the desired picture quality for typical scenes with no excessive motion.

For complex images or frequent changes of image content due to frequent movements, this limit can temporarily be exceeded up to the value entered in the **Maximum bit rate** field.

**Note:** You can change the value in this field only if you select a duration in the field **Averaging period**. If you do not select an **Averaging period**, then the field **Target bit rate** is greyed out.

### Encoding interval

The **Encoding interval** slider determines the interval at which images are encoded and transmitted. This can be particularly advantageous with low bandwidths. The image rate is displayed next to the slider.

### Video resolution

Select the desired resolution for the video image.

**Note:** The value in this field adjusts the resolution for SD streams only.

### Expert settings

If necessary, use the expert settings to adapt the I-frame quality and the P-frame quality to specific requirements. The setting is based on the H.264 quantization parameter (QP).

#### I-frame distance

Use the slider to set the distance between I-frame to **Auto** or to between **3** and **255**. An entry of 3 means that every third image is an I-frame. The lower the number, the more I-frames are generated.

Note that the values supported depend on the GOP structure setting. For example, only even values are supported with IBP; if you have selected IBBP, only 3 or multiples of 3 are supported.

#### Allow enhanced prediction

This function allows for multiple references in H.264 and H.265 streams, which can reduce bitrate. Some decoders do not support this feature and therefore can be disabled.

#### Min. P-frame QP

This parameter allows you to adjust the image quality of the P-frame and to define the lower limit for the quantization of the P-frames, and thus the maximum achievable quality of the P-frames. In the H.264-protocol, the Quantization Parameter (QP) specifies the degree of compression and thus the image quality for every frame. The lower the quantization of the P-frame (QP value), the higher the encoding quality (and thus the best image quality) and the lower the frame refresh rate depending on the settings for the maximum data rate under network settings. A higher quantization value results in low image quality and lower network load. Typical QP values are between 18 and 30.

The basic setting Auto automatically adjusts the quality to the settings for the P-frame video quality.

#### I/P-frame delta QP

This parameter sets the ratio of the I-frame quantization (QP) to the P-frame quantization (QP). For example, you can set a lower value for I-frames by moving the slide control to a negative value. Thus, the quality of the I-frames relative to the P-frames is improved. The total data load will increase, but only by the portion of I-frames. The basic setting Auto automatically adjusts to the optimum combination of movement and image definition (focus). To obtain the highest quality at the lowest bandwidth, even in the case of increased movement in the picture, configure the quality settings as follows:

1. Observe the coverage area during normal movement in the preview images.
2. Set the value for **Min. P-frame QP** to the highest value at which the image quality still meets your needs.
3. Set the value for **I/P-frame delta QP** to the lowest possible value. This is how to save bandwidth and memory in normal scenes. The image quality is retained even in the case of increased movement since the bandwidth is then filled up to the value that is entered under **Maximum bit rate**.

#### Background delta QP

Select the appropriate encoding quality level for a background region defined in Encoder Regions. The lower the QP value, the higher the encoding quality.

#### Object delta QP

Select the appropriate encoding quality level for an object region defined in Encoder Regions. The lower the QP value, the higher the encoding quality.

#### Default

Click **Default** to return the profile to the factory default values.

## 6.8 Encoder Streams

Note: If you access this menu while the camera is recording, the following message appears at the top of the page:

Recording is currently active. Therefore, for 'Current profile' the respective stream profile selected for recording is displayed for information.

### Property

Select one of the resolutions for each stream.

**Note:** In order to select the option “720p (1 MP)” here, you must first set the field **Sensor mode** in **Camera > Installer Menu** to “60 fps.”

The table below identifies the options available in the field **Property** for Stream 1 and the available options in the field **Property** for Stream 2, depending on the options selected for Stream 1.

Option selected for Stream 1 (recording)	Options for Stream 2 (recording)
720p (1 MP)	720p (1 MP)
	SD
	D1 4:3 (cropped)
	640x480

### Non-recording profile

Select one of the following profiles for each stream:

**Note:** Non-recording profiles (streams) are I-frame only.

### JPEG stream

Select the resolution, frame rate, and image quality parameters for the **M-JPEG** stream.

- **Resolution** : Select the appropriate resolution.
- **Max. frame rate:** Select one of the frame rates to be the maximum.
- **Picture quality:** This setting allows you to adjust the quality of the **M-JPEG** image. Use the slide bar to choose a quality between **Low** and **High**.

**Note:** The **M-JPEG** frame rate can vary depending on system loading.

## 6.9 Encoder Regions

User can configure encoding regions for every configured preset (preposition/scene), to increase or decrease the encoding quality for selectable areas of the video image. These regions give better control of the bit rate. Important parts of the scene (identified as objects in the GUI) are encoded at high resolution and therefore have an enhanced encoding quality. Less important parts (such as the sky and trees in the background, all identified as backgrounds in the GUI) are encoded at lower quality and therefore have a decreased encoding quality.

Eight encoder regions can be defined.

Eight encoder regions can be defined. To define encoder regions, follow these steps.

1. From the first drop-down box (the unlabeled Regions selection list), select one of the eight available regions. (The drop-down box has the default option of **Region 1**).
2. Click the + box to add an area.
3. Use the mouse to define the area (shape) that the region covers and to position the area (shape) in the preview of the video image.
  - Drag the center, corner points, or sides of the shaded area (shape).
  - Double-click a side to add additional points to the area (shape).

4. From the last drop-down box (the unlabeled Mode selection list), select the encoder quality for the defined area. (The drop-down box has the default option of *Default*).  
For *unimportant* parts of the video image, select **Background**.  
For *important* parts of the video image, select **Object**.  
(The quality levels for **Background** and for **Object** are defined in the **Expert Settings** section of the page **Encoder Profile**.)
5. For PTZ cameras: From the second drop-down box (the unlabeled Prepositions/Scenes selection list), select a Preposition/Scene to which to add the region. (The drop-down list is *blank* by default unless you have defined at least one scene, in which case the default is **Pre-position 1** or *the custom name for the preposition*).  
**Note:** If you have not yet defined any prepositions/scenes, refer to Prepositions and Tours.
6. If required, select another region and repeat the steps.
7. To remove a region, select the area and click the waste bin icon.
8. Click **Set** to apply the region settings.

## 6.10 Encoder Statistics

### Stream

Identifies the current stream (1, 2, or JPEG).

### Zoom

Identifies the current zoom factor of the camera (1x, 2x, 4x, or 8x).

### Averaging period

Select the appropriate averaging period as a means of stabilizing the long term bit rate.

## 6.11 Privacy Masks

**Note:** The sequence of fields in the GUI may not match the sequence of the fields in this section of the User Manual. In this section of the User Manual, fields appear in a more logical functional sequence, identifying the sequence to create a new privacy mask, and then to update a privacy mask.

**Privacy Masks** block specific areas of a scene from being seen in the camera's field of view. This can be useful when public spaces are in the coverage area or monitoring will be limited to a particular zone.

The areas covered are indicated by a colored pattern (**Black**, **White**, or **Gray**) in the video image. The activated masked areas are filled with the selected pattern in live view.

You can define a total of thirty-two (32) privacy masks in the camera.

A total of eight (8) masks can be in view at the same time.

### Privacy mask

Select the number of the **Privacy mask**. A colored rectangle appears in the unlabeled video preview window above the **Set** button.

Use the mouse to define the area for each privacy mask.

**Privacy Masks** can have multiple corners (which are blue in the preview window) and can form any convex shape.

The default mask template has four corners. You can add or delete corners as needed:

- To add a corner, double-click the side of the mask where you want to add the corner.
- To delete a corner, double-click the corner to remove.
- To amend the shape of a zone, place the cursor over the edge of the zone, hold down the mouse button and drag the edge of the zone to the required position.
- To reposition a zone, place the cursor over the zone, hold down the mouse button and drag into position.

**Notice!**

Draw the mask at 50% optical zoom or less for improved masking performance.  
 Draw the mask 10% larger than the object to ensure that the mask completely covers the object as the camera zooms in and out.

**Pattern**

Select the color of the mask as it will appear in live video: **Black**, **White**, or **Gray**.  
 If you select the **Pattern "Auto,"** the camera adjusts to the brightness or darkness of the background scene of the video. In other words, the color of the **Privacy mask** is the most prevalent of the three (**Black**, **White**, or **Gray**) in the background scene that the **Privacy mask** covers.

**Enabled**

Select this check box to draw the mask for the corresponding **Privacy mask** zone.

Clear this check box to erase the mask for an individual **Privacy mask** zone.

– To hide all privacy masks, click the check box **Disable masks**.

**Note:** You can disable masks individually by deselecting the check box **Disable masks**.

**Mask enlargement**

Select this check box to enlarge all masks automatically while the camera is in motion.

**Zoom threshold**

Click this check box to select the current zoom position at which the mask will appear as the camera zooms in or be hidden as the camera zooms out.

## 6.12

### Picture Settings

#### 5.2.1.1 Color

**White Balance**

Adjusts the color settings to maintain the quality of the white areas of the image.

**Red Gain**

The red gain adjustment offsets the factory white point alignment (reducing red introduces more cyan).

**Blue Gain**

The blue gain adjustment offsets the factory white point alignment (reducing blue introduces more yellow). It is only necessary to change the white point offset for special scene conditions.

**Sodium red level**

Adjust the level of red for sodium vapor lighting with the slider from 0 to 255.

**Sodium blue level**

Adjust the level of blue for sodium vapor lighting with the slider from 0 to 255.

Note: The fields **Sodium red level** and **Sodium blue level** appear only when the value in the field **White balance** is "Sodium lamp auto" or "Sodium lamp."

**Saturation**

Select the percentage of light or color in the video image. The range of options is from 60% to 200%; the default is 100%.

**Color hue**

Select the degree of color in the video image. The range of options is from -14° to 14°; the default is 0°.

### 5.2.1.2 Exposure and gain control

#### Gain control

Adjusts the automatic gain control (AGC).

- **AGC** (default): Automatically adjusts the gain to the lowest possible value needed to maintain a good picture.
- **Fixed**: no enhancement. This setting disables the Max. Gain Level option.

#### Fixed Gain

Use the slide to select the desired number for fixed gain. The default is 2.

To set the **Maximum gain level**, select **Low**, **Medium** or **High** from the drop-down box.

#### AE-response speed

Select the speed of the response of auto exposure. Options are Super slow, Slow, Medium (default), Fast.

#### Shutter Mode

- **Fixed**: The shutter mode is fixed to a selectable shutter speed.
- **Automatic exposure**: increases camera sensitivity by increasing the integration time on the camera. This is accomplished by integrating the signal from a number of consecutive video frames to reduce signal noise.  
If you select this option, the camera disables **Shutter** automatically.

#### Shutter

Adjusts the electronic shutter speed (AES). Controls the time period for which light is gathered by the collecting device. The default setting is 1x (60 Hz: 1/30, 50 Hz: 1/25)

#### Maximum automatic exposure

Use this field to limit the integration time when Frame Integration is active. The range of options is from 1/4 to 1/30 (default).

#### Default shutter limit

The camera tries to hold this shutter value as long as sufficient ambient light is available in the scene.

The range of options is from **1/60** to **1/10000**. The default value is **1/120** for all modes except **Motion** (default **1/500**).

### 5.2.1.3 Day/Night

#### Backlight compensation

Select **Off** to switch off backlight compensation.

Select **On** to capture details in high-contrast and extremely bright-dark conditions.

#### Night mode

Selects night mode (B/W) to enhance lighting in low light scenes. Select from the following options:

- **Monochrome**: Forces the camera to stay in Nigh Mode and transmit monochrome images.
- **Color**: The camera does not switch to Night Mode regardless of ambient light conditions.
- **Auto** (default): The camera switches out of Night Mode after the ambient light level reaches a pre-defined threshold.

#### Night mode threshold

Adjusts the level of light at which the camera automatically switches out of night mode (B/W) operation. Select a value between 10 and 55 (in increments of 5; default 30). The lower the value, the earlier the camera will switch to color mode.

## 6.13 Lens Settings

### Focus speed

Use the slider (from 1 to 8) to control how fast the Auto focus will readjust when the focus becomes blurred.

### IR focus correction

Optimizes the focus for IR lighting. Options are: On, Off (default).

### Maximum zoom speed

Controls the zoom speed.

### Zoom limit

Select the appropriate limit for zooming the camera: 20x, 30x.

### Digital zoom

Digital zoom is a method of decreasing (narrowing) the apparent angle of view of a digital video image. It is accomplished electronically, without any adjustment of the camera's optics, and no optical resolution is gained in the process.

Select **On** to enable this feature.

Select **Off** to disable this feature.

## 6.14 PTZ Settings

### Auto pan speed

Continuously pans the camera at a speed between right and left limit settings. Type a value between 1 and 60 (expressed in degrees), inclusive. The default setting is 30.

### Inactivity

Selects the time period the dome must be not controlled until the inactivity event will be executed.

- **Off** (default): camera remains on a current scene indefinitely.
- **Pre-position 1**: camera returns to **Pre-position 1**.
- **Previous AUX**: camera returns to the previous AUX activity.

### Inactivity period

Determines the behavior of the dome when the control for dome is inactive. Select a time period from the pull-down list (3 sec. - 10 min.). The default setting is 2 minutes.

### Auto pivot

The Auto pivot tilts the camera through the vertical position as the camera is rotated to maintain the correct orientation of the image. Set the Auto Pivot to On (default) to automatically rotate the camera 180° when following a subject traveling directly beneath the camera. To disable this feature, click Off.

### Freeze frame

Select On to freeze the image while the camera moves to a predetermined scene position.

### Tour A / Tour B

Starts and stops the recording of a recorded (guard) tour.

The camera can make up to two (2) recorded tours. A recorded tour saves all manual camera movements made during the recording, including its rate of pan, tilt and zoom speeds, and other lens setting changes. The tour does not capture camera video during the recording of the tour.

**Note 1:** You can save a total of 15 minutes of recorded actions between the two tours.

To record a tour:

1. Click the Start Recording button. The system prompts you to overwrite the existing tour.
2. Click Yes to overwrite the existing tour movements.

3. Click the View Control link, under the image cameo, to access the directional and zoom controls.
4. Use the View Control dialog box to make the necessary camera movements.
5. Click the Stop Recording button to save all actions.

**Note:** **Tour B** is now intended for use with the 'IVA while moving' functions.

You must first calibrate the camera to North before the camera displays accurate compass headings. The camera uses this calibration, usually set to magnetic North, as the zero degree pan position and as the North compass heading. The camera then displays the compass heading based on the number of degrees from the North calibration point.

To set the North calibration point:

1. Determine the North compass heading, then move the camera to that position.
2. Select the radio button **On** for the parameter **Compass**.
3. Click the button next to **North point** to set the calibration point.

#### North point

- Click the **Set** button to overwrite the existing **North point**. A dialog box appears with the message, “Overwrite **North point**?” To confirm, click **OK**. To cancel, click **Cancel**.
- Click the **Clear** button to reset the **North point** to factory defaults. A dialog box appears with the message, “Reset **North point** to factory defaults?” To confirm, click **OK**. To cancel, click **Cancel**.

## 6.15 Pre-positions and Tours

The camera can store up to 256 preset scenes. You can define the individual scenes that comprise a **Pre-position Tour**.

You define individual pre-position scenes, then use these scenes to define the **Pre-position Tour**. The tour starts from the lowest scene number in the tour and progresses sequentially to the highest scene number in the tour. The tour displays each scene for a specified dwell time before advancing to the next scene.

By default, all scenes are part of the **Pre-position Tour** unless removed.

#### To define and edit an individual pre-position:

1. Set the pre-position in the video image.
  - Use the PTZ controls to move the camera into position.
  - Using the Live preview window as reference, navigate to the scene that you want to define as a pre-position.
2. Click the button **Add pre-position (“+”)** to define the pre-position.
3. Select a number for the pre-position, from 1 to 256.
4. Type an optional name for the pre-position, up to 20 characters long.
5. Click OK to save the pre-position to the list **Pre-positions**.
6. To include the pre-position in a standard tour, select the check box to the left of the field “**Include in standard tour (marked with \*)**.” An asterisk (\*) appears to the left of the name in the list **Pre-positions**.
7. For IR cameras only: To add IR light to the pre-position, select the check box to the left of the field “**IR light (marked with #)**”.
8. To delete a pre-position from the list, select the pre-position and click the button **Delete**

**pre-position** ()

9. To overwrite an existing pre-position:
  - Use the PTZ controls to navigate to the new pre-position.
  - In the list **Pre-positions**, select the pre-position that you want to overwrite.

- Click the button **Overwrite pre-position** (disk icon) to apply the new pre-position to the existing pre-position.
  - To change the name of the pre-position, double-click the pre-position in the list. Then, change the name in the dialog box **Edit Pre-position** and click OK.
10. To view a pre-position in the preview window, select the pre-position in the list and click the button **Show pre-position** (eye icon).
  11. To view a pre-position from the **Live** page:
    - Click a pre-position number in the list **Pre-positions**.
    - OR
    - Use the keypad and the button **Show pre-position** in **AUX Control**.

#### To define a Pre-position Tour:

1. Create the individual pre-positions.  
By default, all scenes in the list **Pre-positions** are in the **Pre-position Tour**.
2. To remove a pre-position from the tour, select the pre-position in the list and uncheck the box **Include in standard tour (marked with \*)**.
3. Select a dwell time from the drop-down list **Standard pre-position tour**.
4. To start the **Pre-position Tour**:  
Return to the **Live** page.  
Click **AUX Control**.  
Type **8** in the input box and click **AUX on**.
5. To stop the tour, type **8** and click **AUX off**.

## 6.16 Pre-position mapping

Pre-position mapping allows you to map a function to a pre-position action. This feature works for Bosch protocols and for non-Bosch protocols.

#### Action

Select the appropriate action: Show or Set.

#### Pre-position

Enter the number of the pre-position to map.

#### Function

Select the appropriate function from the drop-down list.

Start auto pan	Gamma mode off
Start auto pan with limit	Gamma mode smart 1
Stop auto pan	Gamma mode smart 2
Start custom tour	Gamma mode smart 3
Stop custom tour	IR focus correction on
Start tour	IR focus correction off
Stop tour	OSD feedback on
Start playback A	OSD feedback off
Stop playback A	IR mode on
Start playback B	IR mode off
Stop playback B	IR mode auto
Compass on	Visible light on

Compass off	Visible light off
Azimuth on	Visible light inhibit on
Azimuth off	Visible light inhibit off
Stabilization auto	Auto tracker on
Stabilization on	Auto tracker off
Stabilization off	Privacy mask on
WDR auto	Privacy mask off
WDR on	Acknowledge alarms
WDR off	Wiper continuous
Night mode auto	Wiper intermittent
Night mode on	Wiper on shot
Night mode off	Wiper off
Gamma mode on	

## 6.17

### Sectors

#### Sector

The camera's pan capability is divided into 16 sectors, for a total of 360°.

#### To define a title for sectors:

1. Place the cursor in the input box to the right of the sector number.
2. Type a title for the sector, up to 20 characters long.
3. To blank the sector, click the check box to the right of the sector title.

## 6.18

### Miscellaneous

#### Fast address

This parameter allows the appropriate camera to be operated via the numerical address in the control system. Enter a number between 0000 and 9999, inclusive, to identify the camera.

## 6.19

### Illuminator

**Note:** This menu page is valid for AUTODOME IP 5000i IR and AUTODOME IP starlight 5000i IR only.

#### IR mode

By default, the camera is set to automatic illuminator mode (Auto). To deactivate this mode, select Off.

#### IR near intensity limit

Select the limit (percentage) of intensity for IR at near focus range. Values range from 0 to 100 (default).

#### IR far intensity limit

Select the limit (percentage) of intensity for IR at far focus range. Values range from 0 to 100 (default).

For both intensity limit parameters, use a lower number to lower the percentage of intensity if the scene is overexposed with IR illumination.

### IR Operation Range

Select the zoom factor or range for the IR light:

- 1X-30X (default)
- 10X-30X
- 15X-30X
- 20X-30X

The focal length of the lens determines the intensity level of the illuminator. The more the camera zooms in, the more power is put on the IR near and far.

### Spotlight mode

Select On to set the camera in spotlight mode, which increases the IR intensity values at the zoom at which the camera is set. Use this mode to see objects at far distances when the camera is zoomed to a wide angle. Note that an IR beam will be visible in the field of view. By default, this option is Off.

## 6.20

### Audio

#### Audio

You can set the gain of the audio signals to suit your specific requirements. The live video image is shown in the window to help you check the audio source. Your changes are effective immediately.

If you connect via Web browser, you must activate the audio transmission on the '**Live**' **functions** page. For other connections, the transmission depends on the audio settings of the respective system.

The audio signals are sent in a separate data stream parallel to the video data, and so increase the network load. The audio data is encoded according to the selected format and requires additional bandwidth. If you do not want any audio data to be transmitted, select **Off**.

#### Input volume

Set the input volume using the slide. Values range from 0 to 119.

#### Line Out

Set the line output gain using the slider. Values range from 0 to 115.

#### Recording format

Select a format for audio recording. The default value is **AAC 48 kbps**. You can select **AAC 80 kbps**, G.711 or L16 depending on the required audio quality or sampling rate.

AAC audio technology is licensed by Fraunhofer IIS.

(<http://www.iis.fraunhofer.de/amm/>)

## 6.21

### Pixel Counter

The number of horizontal and vertical pixels covered by the highlighted area is displayed below the picture. With these values you can check whether the requirements for specific functions, for example, identification tasks, are fulfilled.

1. Click **Freeze** to freeze the camera image if the object that you want to measure is moving.
2. To reposition a zone, place the cursor over the zone, hold down the mouse button and drag into position.
3. To change the shape of a zone, place the cursor over the edge of the zone, hold down the mouse button and drag the edge of the zone to the required position.

## 7 Recording

### 7.1 Introduction to recording

Images can be recorded to an appropriately configured iSCSI system or, for devices with an SD slot, locally to an SD card.

SD cards are the ideal solution for shorter storage times and temporary recordings. They can be used for local alarm recording or to improve the overall reliability of video recording. For long-term authoritative images use an appropriately sized iSCSI system.

Two recording tracks are available (**Recording 1** and **Recording 2**). The encoder streams and profiles can be selected for each of these tracks for both standard and alarm recordings. Ten recording profiles are available where these recording tracks can be defined differently. These profiles are then used for building schedules.

A Video Recording Manager (VRM) can control all recording when accessing an iSCSI system. The VRM is an external program for configuring recording tasks for video servers.

### 7.2 Storage Management

#### 7.2.1 Device manager

An external Video Recording Manager (VRM) system for the unit is configured via the Configuration Manager. The **Managed by Video Recording Manager software** box is only an indicator; it cannot be changed here.

If the **Managed by Video Recording Manager software** box is checked, you are not able to configure any further recording settings on this page.

#### 7.2.2 Recording media

Select a media tab to connect to the available storage media.

##### iSCSI Media

To use an **iSCSI system** as the storage medium, a connection to the desired iSCSI system is required to set the configuration parameters.

The storage system selected must be available on the network and completely set up. It must have an IP address and be divided into logical drives (LUNs).

1. Enter the IP address of the required iSCSI destination in the **iSCSI IP address** field.
2. If the iSCSI destination is password protected, enter the password into the **Password** field.
3. Click **Read**.
  - The connection to the IP address is established.

The **Storage overview** field displays the logical drives.

##### Local Media

An SD card inserted in the camera can be used for local recording.

- To use the SD card for Automatic Network Replenishment (ANR), select the check box.
- If the SD card is password-protected, enter the password into the **Password** field.

The **Storage overview** field displays the local media.

**Note:** The recording performance of the SD card depends on the speed (class) and the performance of the SD card. Bosch recommends an SD card of Class 6 or higher.

**Note:** For more information about Automatic Network Replenishment (ANR), refer to the White Paper “ANR 2.0 Automatic Network Replenishment (ANR),” available on the product page for your camera. Access the product page on the online product catalog from <http://www.boschsecurity.com/corporate/product-catalog/index.html>.

### 7.2.3 Activating and configuring storage media

Available media or iSCSI drives must be transferred to the **Managed storage media** list, activated, and configured for storage.

**Note:**

A iSCSI target storage device can only be associated with one user. If a target is being used by another user, ensure that the current user no longer needs the target before decoupling that user.

1. In the **Storage overview** section, double-click a storage medium, an iSCSI LUN or one of the other available drives.
  - The medium is added as a target in the **Managed storage media** list.
  - Newly added media is shown as **Not active** in the **Status** column.
2. Click **Set** to activate all media in the **Managed storage media** list.
  - The **Status** column shows all media as **Online**.
3. Check the box in the **Rec. 1** or **Rec. 2** column to specify the recording tracks to be recorded on the target selected.

### 7.2.4 Formatting storage media

All recordings on a storage medium can be deleted at any time. Check the recordings before deleting and back-up important sequences on the computer's hard drive.

1. Click a storage medium in the **Managed storage media** list to select it.
2. Click **Edit** below the list.
3. Click **Format** in the new window to delete all recordings in the storage medium.
4. Click **OK** to close the window.

### 7.2.5 Deactivating storage media

A storage medium in the **Managed storage media** list can be deactivated. It is then no longer used for recordings.

1. Click a storage medium in the **Managed storage media** list to select it.
2. Click **Remove** below the list. The storage medium is deactivated and removed from the list.

## 7.3 Recording Profiles

A recording profile contains the characteristics of the tracks that are used for recording. These characteristics can be defined for ten different profiles. The profiles can then be assigned to days or times of day on the **Recording Scheduler** page.

Each profile is color-coded. The names of the profiles can be changed on the **Recording Scheduler** page.

To configure a profile, click its tab to open its settings page.

- To copy the currently visible settings to other profiles, click **Copy Settings**. A window opens to select the target profiles for the copied settings.
- If you change a profile's settings, click **Set** to save.
- If necessary, click **Default** to return all settings to their factory defaults.

### Stream profile settings

Select the encoder profile setting that is to be used with stream 1 and 2 when recording. This selection is independent of the selection for live stream transmission. (The properties of the encoder profiles are defined on the **Encoder Profile** page.)

### Pre-position

Select the appropriate pre-position to record. Options are **Tour A**, **Tour B**, **Custom Tour**, and configured pre-positions.

### Recording includes

You can specify whether, in addition to video data and metadata (for example alarms, VCA data and serial data) should also be recorded. Including metadata could make subsequent searches of recordings easier but it requires additional memory capacity.

### Caution!

Without metadata, it is not possible to include video content analysis in recordings.

### Standard recording

Select the mode for standard recordings:

- **Continuous:** the recording proceeds continuously. If the maximum recording capacity is reached, older recordings are overwritten automatically.
- **Pre-alarm:** recording takes place in the pre-alarm time, during the alarm and during the post-alarm time only.
- **Off:** no automatic recording takes place.

### Stream

Select the stream to be used for standard recordings:

- **Stream 1**
- **Stream 2**
- **I-frames only**

### Alarm recording

Select a period for the **Pre-alarm time** from the list box.

Select a period for the **Post-alarm time** from the list box.

### Alarm stream

Select the stream to be used for alarm recordings:

- **Stream 1**
- **Stream 2**
- **I-frames only**

Check the **encoding interval and bit rates from profile:** box and select an encoder profile to set the associated encoding interval for alarm recording.

Check the **Export to account** box to send standard H.264 or H.265 files to the target whose address is displayed.

If the target has not yet been defined, click **Configure accounts** to jump to the **Accounts** page where the server information can be entered.

### Alarm triggers \*

Select the alarm type that is to trigger an alarm recording:

- **Alarm input**
- **Analysis alarm**

- **Video loss**

Select the **Virtual alarm** sensors that are to trigger a recording, via RCP+ commands or alarm scripts, for example.

## 7.4 Maximum Retention Time

Recordings are overwritten when the retention time entered here has expired.

- ▶ Enter the required retention time in days for each recording track.

Make sure that the retention time does not exceed the available recording capacity.

## 7.5 Recording Scheduler

The recording scheduler allows you to link the created recording profiles with the days and times at which the camera's images are to be recorded in the event of an alarm.

You can link any number of 15-minute intervals with the recording profiles for each day of the week. Moving the mouse cursor over the table displays the time below it. This aids orientation. In addition to the normal weekdays, you can define holidays that are not in the standard weekly schedule on which recordings are to apply. This allows you to apply a schedule for Sundays to other days with dates that fall on varying weekdays.

1. Click the profile you want to link in the **Time periods** field.
2. Click in a field in the table, hold down the mouse button and drag the cursor over all the periods to be assigned to the selected profile.
3. Use the right mouse button to deselect any of the intervals.
4. Click the **Select All** button to link all time intervals to the selected profile.
5. Click the **Clear All** button to deselect all of the intervals.
6. When you are finished, click the **Set** button to save the settings in the unit.

### Holidays

You can define holidays that are not in the standard weekly schedule on which recordings are to apply. This allows you to apply a schedule for Sundays to other days with dates that fall on varying weekdays.

1. Click the **Holidays** tab. Any days that have already been selected will be shown in the table.
2. Click the **Add** button. A new window will open.
3. Select the desired date from the calendar. You can select several consecutive calendar days by holding down the mouse button. These will later be displayed as a single entry in the table.
4. Click **OK** to accept the selection. The window will close.
5. Assign the individual holidays to the recording profiles, as described above.

### Deleting Holidays

You can delete holidays you have defined yourself at any time.

1. Click the **Delete** button. A new window will open.
2. Click the date you wish to delete.
3. Click **OK**. The item will be deleted from the table and the window will close.
4. The process must be repeated for deleting additional days.

### Time periods

You can change the names of the recording profiles.

1. Click a profile and then the **Rename** button.
2. Enter your chosen name and then click the **Rename** button again.

### Activating the Recording

After completing configuration you must activate the recording scheduler and start the recording. Once recording is underway, the **Recording Profiles** and **Recording Scheduler** pages are deactivated and the configuration cannot be modified.

You can stop the recording activity at any time and modify the settings.

1. Click the **Start** button to activate the recording scheduler.
2. Click the **Stop** button to deactivate the recording scheduler. Running recordings are interrupted and the configuration can be changed.

### Recording status

The graphic indicates the recording activity of the camera. You will see an animated graphic while recording is taking place.

## 7.6 Recording Status

Details of the recording status are displayed here for information. These settings cannot be changed.

## 7.7 Recording Statistics

### Recording

Identifies the current recording profile (1 or 2).

### Zoom

Identifies the current zoom factor of the camera (1x, 2x, 4x, or 8x).

### Averaging period

Select the appropriate averaging period as a means of stabilizing the long term bit rate.

## 7.8 Image Posting

### Image size

Select the appropriate image size: Small, Medium, Large, 720p, 1080p, **Best possible**.

### File name

You can select how file names will be created for the individual images that are transmitted.

- **Overwrite** The same file name is always used and any existing file will be overwritten with the current file.
- **Increment** A number from 000 to 255 is added to the file name and automatically incremented by 1. When it reaches 255 it starts again from 000.
- **Date/time suffix** The date and time are automatically added to the file name. When setting this parameter, ensure that the unit's date and time are always correctly set. Example: the file snap011005\_114530.jpg was stored on October 1, 2005 at 11:45 and 30 seconds.

### VCA overlays

To include VCA overlays in the email, select this check box.

### Posting interval

Enter the interval in seconds at which the images will be sent to an FTP server. Enter 0 (zero) if you do not want any images to be sent.

The following field may or may not appear, depending on your camera:

### Post JPEG from camera

Click the checkbox to select the cameras from which JPEG images are sent. An enabled video input is indicated by a check mark.

**Target**

Select the target—the name of the account on the server—to which to save images. When face recognition is available, selected images of the face can be sent to a target account.

**Enable**

Check the box to enable best face posting.

**File format**

Select the type of image to be sent.

**Target**

Select the target account for best face posting.

**Timeout**

Fill in the timeout in seconds. Leave at 0 for no timeout.

**Maximum image width [px]**

Fill in the maximum image width in pixels. Leave at 0 for automatic width selection.

## 7.9

### SD Card Status

This section identifies the following details about the SD card installed in the camera:

- **Manufacturer**
- **Product**
- **Size**
- **Lifespan Check**
- **Lifespan**
- **Lifespan alarm**

## 8

## Alarm

### 8.1

### Alarm Connections

You can select how the camera responds to an alarm. In the event of an alarm, the unit can automatically connect to a pre-defined IP address. You can enter up to ten IP addresses to which the camera will connect in sequence in the event of an alarm, until a connection is made.

#### Connect on alarm

Select **On** so that the camera automatically connects to a predefined IP address in the event of an alarm.

By setting **Follows input 1\***, the unit maintains the connection that has been automatically established for as long as an alarm exists on alarm input 1.

#### Notice!

In the default setting, Stream 2 is transmitted for alarm connections. Consider this when assigning the profile (see Encoder Profile).

#### Number of destination IP address

Specify the numbers of the IP addresses to be contacted in the event of an alarm. The unit contacts the remote stations one after the other in the numbered sequence until a connection is made.

#### Destination IP address

For each number, enter the corresponding IP address for the desired remote station.

#### Destination password

If the remote station is password protected, enter the password here.

Only ten passwords can be defined here. Define a general password if more than ten connections are required. The unit connects to all remote stations protected by the same general password. To define a general password:

1. Select 10 in the **Number of destination IP address** list box.
2. Enter 0.0.0.0 in the **Destination IP address** field.
3. Enter the password in the **Destination password** field.
4. Set the user password of all the remote stations to be accessed using this password. Setting destination 10 to the IP-address 0.0.0.0 overrides its function as the tenth address to try.

#### Video transmission

If the unit is operated behind a firewall, select **TCP (HTTP port)** as the transfer protocol. For use in a local network, select **UDP**.

#### Caution!

Please note that in some circumstances, a larger bandwidth must be available on the network for additional video images in the event of an alarm, in case Multicast operation is not possible. To enable Multicast operation, select the **UDP** option for the **Video transmission** parameter here and on Network Access.

#### Stream

Select the number of the stream from the drop-down list.

**Remote port**

Depending on the network configuration, select a browser port here. The ports for HTTPS connections will be available only if the **On** option is selected in the **SSL encryption** parameter.

**Video output**

If you know which unit is being used as the receiver, you can select the analog video output to which the signal should be switched. If the destination unit is unknown, it is advisable to select the **First available** option. In this case, the image is placed on the first free video output. This is an output on which there is no signal. The connected monitor only displays images when an alarm is triggered. If you select a particular video output and a split image is set for this output on the receiver, you can also select from **Decoder** the decoder in the receiver that is to be used to display the alarm image.

**Notice!**

Refer to the destination unit documentation concerning image display options and available video outputs.

**Decoder**

If a split image is set for the selected video output, select a decoder to display the alarm image. The decoder selected determines the position in the split image.

**SSL encryption**

SSL encryption protects data used for establishing a connection, such as the password. By selecting **On**, only encrypted ports are available for the **Remote port** parameter. SSL encryption must be activated and configured on both sides of a connection. The appropriate certificates must also have been uploaded. (Certificates can be uploaded on the **Maintenance** page.)

Configure and activate encryption for media data (such as video, metadata or audio when available) on the **Encryption** page (encryption is only available if the appropriate license is installed).

**Auto-connect**

Select the **On** option to automatically re-establish a connection to one of the previously specified IP addresses after each reboot, after a connection breakdown or after a network failure.

**Notice!**

In the default setting, Stream 2 is transmitted for automatic connections. Bear this fact in mind when assigning the profile (see Encoder Profile).

The following field may or may not appear, depending on your camera:

**Audio**

Select **On** to activate audio alarms.

The following field may or may not appear, depending on your camera:

## 8.2 Video Content Analysis (VCA)

**Note:** This section of the manual provides an overview of the fields and the options for each field on the page **VCA**. This section is not a complete tutorial of setting up **VCA**. For more information, refer to the separate manual *Video Content Analysis (VCA)*, available on the product page for Intelligent Video Analytics. Access the product page on the online product catalog from <http://www.boschsecurity.com/corporate/product-catalog/index.html>.

**Note:** If there is not enough computing power, priority is given to live images and recordings. This can lead to impairment of the VCA system. Observe the processor load and optimize the encoder settings or the VCA settings if necessary, or turn off VCA completely.

### Help for VCA settings

A separate Help file provides information about configuring for the VCA settings.

**Note:** Full VCA configuration and Help is only available on the web browser when MPEG ActiveX software from Bosch is installed on your computer. MPEG ActiveX software is available from the Bosch Security Systems DownloadStore (<https://downloadstore.boschsecurity.com/>)

To open the VCA Help in the web browser:

1. Select **Configuration > Alarm >> VCA**
2. Click **Configuration**. The VCA **Settings** window appears.
3. Ensure that the VCA **Settings** window is on top and active. If not, click the **Settings** window.
4. Press **F1**.

### VCA configuration

Select one of the profiles here to activate it or edit it.

You can rename the profile.

1. To rename the file, click the icon to the right of the list field and enter the new profile name in the field.
2. Click the icon again. The new profile name is saved.

Do not use any special characters, for example **&**, in the name. Special characters are not supported by the system's internal management.

The default option is Profile #1.

If you select the option Silent VCA, then the system creates metadata to facilitate searches of recordings but no alarm is triggered. You cannot change any parameters for this configuration. If you want to turn off VCA, then select Off.

If necessary, click the button **Default** to return all settings to their default values. A dialog box appears with the message, "**Configuration of the video content analysis (VCA) will be reset to factory defaults. The changes will be lost. Click 'OK' to continue.**" Click **OK** to acknowledge the message, or click **Cancel**.

### Alarm status

The alarm status is displayed here for information purposes. This means you can check the effects of your settings immediately.

### Aggregation time [s]

Set an aggregation time of between 0 and 20 seconds. The aggregation time always starts when an alarm event occurs. It extends the alarm event by the value set. This prevents alarm events that occur in quick succession from triggering several alarms and successive events in a rapid sequence. No further alarm is triggered during the aggregation time.

The post-alarm time set for alarm recordings only starts once the aggregation time has expired.

### Tamper detection

Detect tampering of cameras and video cables by means of various options. Run a series of tests at different times of the day and night to ensure that the video sensor is operating as intended.

**Sensitivity** and **Trigger delay [s]** can only be changed if **Reference check** is selected.

#### Reference check

Save a reference image that can be continuously compared with the current video image. If the current video image in the marked areas differs from the reference image, an alarm is triggered. This detects tampering that would otherwise not be detected, for example, if the camera is turned.

1. Click **Reference** to save the currently visible video image as a reference.
2. Click **Add mask** and select the areas in the reference image that are to be ignored. Click **Set** to apply.
3. Check the box **Reference check** to activate the on-going check. The stored reference image is displayed in black and white below the current video image.
4. Select the **Disappearing edges** or **Appearing edges** option to specify the reference check once again.

#### Sensitivity

The basic sensitivity of the tamper detection can be adjusted for the environmental conditions to which the camera is subject. The algorithm reacts to the differences between the reference image and the current video image. The darker the observation area, the higher the value that must be selected.

#### Trigger delay [s]

Set delayed alarm triggering here. The alarm is only triggered after a set time interval in seconds has elapsed and then only if the triggering condition still exists. If the original condition has been restored before this time interval elapses, the alarm is not triggered. This avoids false alarms triggered by short-term changes, for example, cleaning activities in the direct field of vision of the camera.

#### Disappearing edges

The area selected in the reference image should contain a prominent structure. If this structure is concealed or moved, the reference check triggers an alarm. If the selected area is too homogenous, so that concealing and moving the structure would not trigger an alarm, then an alarm is triggered immediately to indicate the inadequate reference image.

#### Appearing edges

Select this option if the selected area of the reference image includes a largely homogenous surface. If structures appear in this area, then an alarm is triggered.

#### Global change

Activate this function if the global change, as set with the Global change slide control, should trigger an alarm.

#### Global change (slider)

Set how large the global change in the video image must be for an alarm to be triggered. This setting is independent of the sensor fields selected under **Mask...** Set a high value if fewer sensor fields need to change to trigger an alarm. With a low value, it is necessary for changes to occur simultaneously in a large number of sensor fields to trigger an alarm. This option allows detection, independently of motion alarms, manipulation of the orientation or location of a camera resulting from turning the camera mount bracket, for example.

**Scene too bright**

Activate this function if tampering associated with exposure to extreme light (for instance, shining a flashlight directly on the lens) should trigger an alarm.

Use the slider to set the threshold of the alarm trigger.

**Scene too dark**

Activate this function if tampering associated with covering the lens (for instance, by spraying paint on it) should trigger an alarm.

Use the slider to set the threshold of the alarm trigger.

**8.3****Audio Alarm**

The camera can create alarms on the basis of audio signals. You can configure signal strengths and frequency ranges in such a way that false alarms, for example due to machine noise or background noise, are avoided.

**Notice!**

First set up normal audio transmission before you configure the audio alarm here (see Audio).

**Audio alarm**

Select **On** if you want the device to generate audio alarms.

Do not use any special characters, for example **&**, in the name. Special characters are not supported by the system's internal management.

**Signal Ranges**

You can exclude particular signal ranges in order to avoid false alarms. For this reason the total signal is divided into 13 tonal ranges (mel scale). Check or uncheck the boxes below the graphic to include or exclude individual ranges.

**Threshold**

Set up the threshold on the basis of the signal visible in the graphic. You can set the threshold using the slide control or, alternately, you can move the white line directly in the graphic using the mouse.

**Sensitivity**

You can use this setting to adapt the sensitivity to the sound environment. You can effectively suppress individual signal peaks. A high value represents a high level of sensitivity.

**8.4****Alarm E-Mail**

As an alternative to automatic connecting, alarm states can also be documented by e-mail. In this way it is possible to notify a recipient who does not have a video receiver. In this case, the camera automatically sends an e-mail to a previously defined e-mail address.

**Send alarm e-mail**

Select **On** if you want the unit to automatically send an alarm e-mail in the event of an alarm.

**Mail server IP address**

Enter the IP address of a mail server that operates on the SMTP standard (Simple Mail Transfer Protocol). Outgoing e-mails are sent to the mail server via the address you entered. Otherwise leave the box blank (**0.0.0.0**).

**SMTP port**

Select the appropriate SMTP port.

**SMTP user name**

Enter a registered user name for the chosen mailserver here.

**SMTP password**

Enter the required password for the registered user name here.

**Format**

You can select the data format of the alarm message.

- **Standard (with JPEG)** E-mail with attached JPEG image file.
- **SMS** E-mail in SMS format to an e-mail-to-SMS gateway (for example to send an alarm by cellphone) without an image attachment.

**Caution!**

When a cellphone is used as the receiver, make sure to activate the e-mail or SMS function, depending on the format, so that these messages can be received.

You can obtain information on operating your cellphone from your cellphone provider.

**Image size**

Select the appropriate image size: Small, Medium, Large, 720p, 1080p, **Best possible**.

**Attach JPEG from camera**

Click the checkbox to specify that JPEG images are sent from the camera. An enabled video input is indicated by a check mark.

**VCA overlays**

Select the **VCA overlays** check box, to place the outline of the object that triggered an alarm into the camera image sent as snapshot via e-mail.

**Destination address**

Enter the e-mail address for alarm e-mails here. The maximum address length is 49 characters.

**Sender address**

Enter a unique name for the e-mail sender, for example the location of the device. This will make it easier to identify the origin of the e-mail.

**Note:** The name must include at least two character groups separated by a blank (for example, Parking Garage) in order for the system to generate an email from that name, as in "From Parking Garage". Text with only one group of characters (for example, Lobby) will not generate an email.

**Test e-mail**

You can test the e-mail function by clicking the **Send Now** button. An alarm e-mail is immediately created and sent.

## 8.5

### Alarm Task Editor

Editing scripts on this page overwrites all settings and entries on the other alarm pages. This procedure cannot be reversed.

To edit this page, you should have programming knowledge and be familiar with the information in the Alarm Task Script Language document and the English language.

As an alternative to the alarm settings on the various alarm pages, enter the desired alarm functions in script form here. This will overwrite all settings and entries on the other alarm pages.

1. Click **Examples** under the Alarm Task Editor field to see some script examples. A new window opens.

2. Enter new scripts in the Alarm Task Editor field or change existing scripts in line with your requirements.
3. When finished, click **Set** to transmit the scripts to the device. If the transfer was successful, the message **Script successfully parsed.** is displayed over the text field. If it was not successful, an error message is displayed with further information.

## 8.6 Alarm Rules

An alarm rule can define which input(s) activate which output(s). Basically, an alarm rule allows you to customize the camera to respond automatically to different alarm inputs. To configure an alarm rule, specify one input from a physical connection, from a motion detection trigger, or from a connection to the camera's LIVE page. The physical input connection can be activated by dry contact devices such as pressure pads, door contacts, and similar devices.

Next, specify up to two (2) rule outputs, or the camera's response to the input. Outputs include a physical alarm output, an AUX command, or a preposition scene.

Select one of the following output commands for both Output 1 and Output 2 settings:

Note: Not all options are available for all cameras.

- **None:** no defined command.
- **AUX on:** defines a standard or custom keyboard ON command.
- **AUX off:** defines a standard or custom keyboard OFF command.
- **Pre-position:** defines a pre-position from shot 1-256. (Note: This option is not available for the input **Time range.**)

(Refer to the "AUX Commands" section of the manual for a list of all AUX commands for your camera.)

Click the checkbox **Enabled** to activate the alarm.

Click Set to save. The camera's system activates the alarm rules.

## 9 Network

The settings on these pages are used to integrate the device into a network. Some changes only take effect after a reboot. In this case **Set** changes to **Set and Reboot**.

1. Make the desired changes.
2. Click **Set and Reboot**.

The device is rebooted and the changed settings are activated.

### 9.1 Network Services

This page shows an overview of all available network services. Use the checkbox to activate or deactivate a network service. Click on the settings symbol next to the network service to go to the settings page for this network service.

Select the appropriate network services from the list on the page:

- HTTP
- HTTPS
- RSTP
- RCP
- FTP
- SNMP
- iSCSI
- UPnP
- NTP server
- Discovery
- ONVIF discovery
- GB/T 28181
- Password reset mechanism
- Ping response

### 9.2 Network Access

The settings on this page are used to integrate the camera into an existing network.

#### Automatic IPv4 assignment

If the network has a DHCP server for the dynamic assignment of IP addresses, select **On** or **On plus Link-Local** to automatically accept the DHCP-assigned IP address.

If no DHCP server is available select **On plus Link-Local** to automatically assign a Link-Local (Auto-IP) address.

For certain applications, the DHCP server must support the fixed assignment between IP address and MAC address, and must be appropriately set up so that, once an IP address is assigned, it is retained each time the system is rebooted.

#### IPv4

Fill in the 3 fields in this section of the screen.

#### IP address

Enter the desired IP address for the camera in this field. The IP address must be valid for the network.

#### Subnet mask

Enter the appropriate subnet mask for the selected IP address here.

#### Gateway address

If you want the unit to establish a connection to a remote location in a different subnet, enter the IP address of the gateway here. Otherwise leave the box blank (**0.0.0.0**).

## IPv6

Consult with the network administrator before making changes to this section.

### IP address

Enter the desired IP address for the camera in this field. The IP address must be valid for the network. A typical IPv6 address may resemble the following example:

2001:db8: :52:1:1

Consult the network administrator for valid IPv6 address construction.

### Prefix length

A typical IPv6 node address consists of a prefix and an interface identifier (total 128 bits). The prefix is the part of the address where the bits have fixed values or are the bits that define a subnet.

### Gateway address

If you want the unit to establish a connection to a remote location in a different subnet, enter the IP address of the gateway here. Otherwise leave the box blank (**0.0.0.0**).

### DNS server address 1 / DNS server address 2

The camera is easier to access if the unit is listed on a DNS server. If you wish, for example, to establish an Internet connection to the camera, it is sufficient to enter the name given to the unit on the DNS server as a URL in the browser. Enter the IP address of the DNS server here. Servers are supported for secure and dynamic DNS.

### Video transmission

If the unit is operated behind a firewall, select **TCP (HTTP port)** as the transfer protocol. For use in a local network, select **UDP**.

### Notice!

Multicast operation is only possible with the UDP protocol. The TCP protocol does not support multicast connections. The MTU value in UDP mode is 1,514 bytes.

### HTTP browser port

Select a different HTTP browser port from the list if required. The default HTTP port is 80. If you want to allow only secure connections via HTTPS, you must deactivate the HTTP port. In this case, select **Off**.

### HTTPS browser port

If you wish to allow browser access on the network via a secure connection, select an HTTPS browser port from the list if necessary. The default HTTPS port is 443. Select the **Off** option to deactivate HTTPS ports; only unsecured connections will now be possible.

The camera uses the TLS 1.0 encryption protocol. You may have to activate this protocol via your browser configuration. You must also activate the protocol for the Java applications (via the Java control panel in the Windows control panel).

### Notice!

If you want to allow only secure connections with SSL encryption, you must select the **Off** option for each of the parameters **HTTP browser port**, **RCP+ port 1756** and **Telnet support**. This deactivates all unsecured connections. Connections will then only be possible via the HTTPS port.

You can activate and configure encryption of the media data (video and metadata) on the **Encryption** page (see Encryption).

**Min. TLS version**

Select the version for minimum Transport Layer Security (TLS).

**HSTS**

Select this option to use the web security policy HTTP Strict Transport Security (HSTS) to provide secure connections.

**RCP+ port 1756**

To exchange connection data, you can activate the unsecured RCP+ port 1756. If you want connection data to be transmitted only when encrypted, select the **Off** option to deactivate the port.

**Discovery port**

Enter the number of the port that you want to discover.

To deactivate the port, enter 0.

**Interface mode ETH**

Select the Ethernet link type for the ETH interface.

Options are:

- Auto
- 10 Mbps HD (half duplex)
- 10 Mbps FD (full duplex)
- 100 Mbps HD (half duplex)
- 100 Mbps FD (full duplex)

**Network MSS (Byte)**

You can set the maximum segment size for the IP packet's user data. This gives you the option to adjust the size of the data packets to the network environment and to optimize data transmission. Please comply with the MTU value of 1,514 bytes in UDP mode.

**iSCSI MSS (Byte)**

You can specify a higher MSS value for a connection to the iSCSI system than for the other data traffic via the network. The potential value depends on the network structure. A higher value is only useful if the iSCSI system is located in the same subnet as the camera.

**Network MTU [Byte]**

Specify a maximum value in bytes for the package size (including IP header) to optimize data transmission.

## 9.3

### DynDNS

**Enable DynDNS**

DynDNS.org is a DNS hosting service that stores IP addresses in a database ready for use. It allows you to select the camera via the Internet using a host name, without having to know the current IP address of the unit. You can enable this service here. To do this, you must have an account with DynDNS.org and you must have registered the required host name for the unit on that site.

**Notice!**

Information about the service, registration process and available host names can be found at DynDNS.org.

**Provider**

The value in this field defaults to dyndns.org. Select another option as necessary.

**Host name**

Enter the host name registered on DynDNS.org for the camera here.

**User name**

Enter the user name you registered at DynDNS.org here.

**Password**

Enter the password you registered at DynDNS.org here.

**Force registration now**

You can force the registration by transferring the IP address to the DynDNS server. Entries that change frequently are not provided in the Domain Name System. It is a good idea to force the registration when you are setting up the device for the first time. Only use this function when necessary and no more than once a day, to avoid the possibility of being blocked by the service provider. To transfer the IP address of the camera, click the **Register** button.

**Status**

The status of the DynDNS function is displayed here for information purposes. You cannot change any of these settings.

## 9.4

### Advanced

The settings on this page are used to implement advanced settings for the network.

**Operation**

The operation mode determines how the camera communicates with Cloud-based Security and Services.

- Select **Auto** to allow the camera to poll the server a few times; if no contact is made, it stops polling.
- Select **On** to constantly poll the server.
- Select **Off** to block polling.

**Cloud state**

This field identifies any cloud-based services with which the camera communicates.

- If you have registered the device on a cloud-based service such as Bosch Remote Portal, then this field identifies this fact ("**Registered on Bosch Remote Portal**").

**Note:** The button (**Connect to Bosch Remote Portal**) to connect to the device with that service is active.

- If you have not registered the device, then the message, "**Not running. (Automatic IP assignment not active)**" appears.

**Note:** The button (**Connect to Bosch Remote Portal**) to connect to the device with that service is not active.

**Stratocast**

Enter the Stratocast **Registration code** to connect with the Genetec's Stratocast cloud.

Click **Register** to activate the account.

**Authentication**

If a RADIUS server is employed in the network for managing access rights, authentication must be activated here to allow communication with the unit. The RADIUS server must also contain the corresponding data.

To configure the unit, you must connect the camera directly to a computer using a network cable. This is because communication via the network is not enabled until the **Identity** and **Password** parameters have been set and successfully authenticated.

**Identity**

Enter the name that the RADIUS server is to use for identifying the camera.

**Password**

Enter the password that is stored in the RADIUS server.

**TCP port**

The device can receive data from an external TCP sender, for example an ATM or POS device, and store it as metadata. Select the port for TCP communication. Select Off to deactivate the TCP metadata function.

**Sender IP address**

Enter the IP address of the TCP metadata sender here.

**Server IP address**

Enter the appropriate IP address of the server.

**Server port (0 = Off)**

Enter the number of the server port.

**Protocol**

Select the appropriate protocol: **UDP**, **TCP**, or **TLS**.

**Requested for camera**

The value in this field identifies the number of watts requested for the camera.

**Additional Power**

Enter the number of additional watts that you want the camera to use.

**Requested total**

The value in this field is the total number of watts from the fields **Requested for camera** and **Additional Power**.

**Allocated power**

The value in this field is the number of watts of allocated power to the camera.

## 9.5

## Network Management

**SNMP**

The camera supports the SNMP V1 (Simple Network Management Protocol) for managing and monitoring network components, and can send SNMP messages (traps) to IP addresses. The unit supports SNMP MIB II in the unified code. If you wish to send SNMP traps, enter the IP addresses of one or two required target devices here.

If you select **On** for the **SNMP** parameter and do not enter an SNMP host address, the camera does not send them automatically, but only replies to SNMP requests. If you enter one or two SNMP host addresses, SNMP traps are sent automatically. Select **Off** to deactivate the SNMP function.

**1. SNMP host address / 2. SNMP host address**

If you wish to send SNMP traps automatically, enter the IP addresses of one or two required target units here.

**SNMP traps**

You can select which traps are to be sent.

1. Click **Select**. A list is opened.
2. Click the checkboxes to select the required traps. All the checked traps will be sent.
3. Click **Set** to accept the selection.

**UPnP**

Select **On** to activate UPnP communication. Select **Off** to deactivate it.

When the Universal Plug-and-Play (UPnP) function is activated, the unit responds to requests from the network and is automatically registered on the requesting computers as a new network device. This function should not be used in large installations due to the large number of registration notifications.

**Note:**

To use the UPnP function on a Windows computer, both the Universal Plug-and-Play Device Host and the SSDP Discovery Service must be activated.

The priority of the different data channels can be set by defining the DiffServ Code Point (DSCP). Enter a number between 0 and 252 as a multiple of four. For alarm video you can set a higher priority than for regular video and you can define a Post Alarm Time over which this priority is maintained.

## 9.6

### Multicast

In addition to a 1:1 connection between an encoder and a single receiver (unicast), the camera can enable multiple receivers to receive the video signal from an encoder simultaneously. The device either duplicates the data stream itself and then distributes it to multiple receivers (Multi-unicast) or it sends a single data stream to the network, where the data stream is simultaneously distributed to multiple receivers in a defined group (Multicast). You can enter a dedicated multicast address and port for each stream. You can switch between the streams by clicking the appropriate tabs.

**Notice!**

Multicast operation requires a multicast-enabled network that uses the UDP and the Internet Group Management IGMP protocols. Other group management protocols are not supported. The TCP protocol does not support multicast connections.

A special IP address (class D address) must be configured for multicast operation in a multicast-enabled network.

The network must support group IP addresses and the Internet Group Management Protocol (IGMP V2). The address range is from 225.0.0.0 to 239.255.255.255.

The multicast address can be the same for multiple streams. However, it will be necessary to use a different port in each case so that multiple data streams are not sent simultaneously using the same port and multicast address.

**Notice!**

The settings must be made individually for each stream.

**Enable**

To enable simultaneous data reception on several receivers you need to activate the multicast function. To do this, check the box. You can then enter the multicast address.

**Multicast Address**

Enter a valid multicast address for each stream to be operated in multicast mode (duplication of the data streams in the network).

With the setting **0.0.0.0** the encoder for the relevant stream operates in multi-unicast mode (copying of data streams in the unit). The camera supports multi-unicast connections for up to five simultaneously connected receivers.

**Notice!**

Duplication of data places a heavy demand on the unit and can lead to impairment of the image quality under certain circumstances.

**Port**

Assign a different port to each data stream if there are simultaneous data streams at the same multicast address.

Enter the port address of the required stream here.

**Streaming**

Click the checkbox to activate multicast streaming mode for the relevant stream. An enabled stream is indicated by a check mark.

**Multicast packet TTL**

You can enter a value to specify how long the multicast data packets are active on the network. This value must be greater than one if multicast is to be run via a router.

## 9.7

### Image Posting

**Image size**

Select the appropriate image size: Small, Medium, Large, 720p, 1080p, **Best possible**.

**File name**

You can select how file names will be created for the individual images that are transmitted.

- **Overwrite** The same file name is always used and any existing file will be overwritten with the current file.
- **Increment** A number from 000 to 255 is added to the file name and automatically incremented by 1. When it reaches 255 it starts again from 000.
- **Date/time suffix** The date and time are automatically added to the file name. When setting this parameter, ensure that the unit's date and time are always correctly set. Example: the file snap011005\_114530.jpg was stored on October 1, 2005 at 11:45 and 30 seconds.

**VCA overlays**

To include VCA overlays in the email, select this check box.

**Posting interval**

Enter the interval in seconds at which the images will be sent to an FTP server. Enter 0 (zero) if you do not want any images to be sent.

The following field may or may not appear, depending on your camera:

**Post JPEG from camera**

Click the checkbox to select the cameras from which JPEG images are sent. An enabled video input is indicated by a check mark.

**Target**

Select the target—the name of the account on the server—to which to save images.

When face recognition is available, selected images of the face can be sent to a target account.

**Enable**

Check the box to enable best face posting.

**File format**

Select the type of image to be sent.

**Target**

Select the target account for best face posting.

**Timeout**

Fill in the timeout in seconds. Leave at 0 for no timeout.

**Maximum image width [px]**

Fill in the maximum image width in pixels. Leave at 0 for automatic width selection.

## 9.8

### Accounts

Four separate accounts can be defined for posting and recording export.

**Type**

Select either FTP or Dropbox for the account type.

Before using a Dropbox account ensure that the time settings of the device have been correctly synchronized.

**Account name**

Enter an account name to be shown as the target name.

**IP address**

Enter the IP address of the server on which you wish to save the JPEG images.

**Login**

Enter the login ID for the server.

**Password**

Enter the password that gives you access to the server. To verify the password, click the Check button to the right.

**Path**

Enter the exact path on which you wish to post the images on the server. To browse for the correct path, click the Browse button to the right.

**Maximum bit rate**

Enter the maximum bit rate for the JPEG images (in kbps).

**Encryption**

Tick the box to use a secure FTP over TLS connection.

## 9.9

### IPv4 Filter

Use this setting to configure a filter that allows or blocks network traffic that matches a specified address or protocol.

**IP Address 1 / 2**

Enter the IPv4 address that you want to allow or block

**Mask 1 / 2**

Enter the subnet mask for the appropriate IPv4 address.

## 9.10

### Encryption

If an encryption license is installed, this submenu gives access to the encryption parameters.

## 10

### 10.1

## Service

### Maintenance

#### Update server

The address of the update server appears in the address box.

1. Click **Check** to make a connection to this server.
2. Select the appropriate version for your camera to download the firmware from the server.

#### Firmware

The camera functions and parameters can be updated by uploading new firmware. To do this, the latest firmware package is transferred to the device via the network. The firmware is installed there automatically. Thus, a camera can be serviced and updated remotely without requiring a technician to make changes to the device on site. The latest firmware can be obtained from your customer service center or from the download area.

#### Notice!

Before starting a firmware update, make sure to select the correct upload file.

Do not interrupt the firmware installation. Even changing to another page or closing the browser window leads to interruption.

Uploading the wrong files or interrupting the upload can result in the device no longer being addressable, requiring it to be replaced.

#### Caution!

Do not remove power to the unit during a factory default or a firmware update. Wait at least two minutes for the default process to complete. If the unit appears to be "frozen" after two minutes, then reboot the unit. Refer to *Troubleshooting, page 65* for more details.

#### Progress

The progress bar displays the progress of the firmware upload.

**Note:** Once the progress bar reaches 100%, a reset page may appear. If this page appears, allow the reset page to complete its action.

#### Upload history

Click **Show** to view the firmware upload history.

#### Configuration

Click **Browse...** to navigate to the required firmware file (\*.fw).

**Note:** Ensure that the file to be loaded comes from the same unit type as the unit that you want to configure.

Click **Upload** to begin transferring the file to the unit. Click OK to the warning message to continue the firmware upload, or Cancel to stop the upload.

Click **Download** to save the camera settings to a file to upload to the same camera or to a similar camera in the future.

#### Maintenance log

You can download an internal maintenance log from the unit to send it to Customer Service for support purposes. Click **Download** and select a storage location for the file.

## 10.2

## Licenses

This window is for the activation of additional functions by entering activation codes. An overview of installed licenses is shown. The installation code of the unit is also displayed here.

## 10.3 Certificates

### Add a certificate/file to the file list

Click **Add**.

In the Add certificate window choose either:

- **Upload certificate** to select a file that is already available:
  - Click **Browse** to navigate to the required file.
  - Click **Upload**.
- **Generate signing request** for a signing authority to create a new certificate:
  - Fill in all the required fields and click **Generate**.
- **Generate certificate** to create a new self-signed certificate:
  - Fill in all the required fields and click **Generate**.

### Delete a certificate from the file list

Click the trashcan icon to the right of the certificate. The Delete file window appears. To confirm deletion, click OK. To cancel deletion, click Cancel.

**Note:** You can only delete certificates that you have added; you cannot delete the default certificate.

## 10.4 Logging

### Current log level

Select the level of event for which to display log entries or to log.

### Number of displayed entries

Select the number of entries to display.

### Enable software sealing

Select this check box to enable software protection that prevents users from adjusting camera settings. This function also protects the camera from unauthorized access.

## 10.5 Diagnostics

Accesses the Built-in Self Test (BIST). The BIST displays a Pass or Fail status on the most recent homing event, not a counter. For the other items, a counter is maintained.

Click the **Start Self test** button to display the number of times the camera:

- performed a homing event.
- failed to home properly.
- restarted.
- lost video.

### Logs

This section updates automatically with the history of the camera and maintains a log of all events such as those listed below. Click the REFRESH button to reload log data.

## 10.6 System Overview

This window is for information only and cannot be modified. Keep this information at hand when seeking technical support.

Select the text on this page with a mouse and copy it so that it can be pasted into an e-mail if required.

## 11 AUX Commands

AUX	Function	Command	Description
1	On/Off	AutoPan without limits (Continuous)	
2	On/Off	Auto Pan between limits	
7	On/Off	Run Custom Pre-Position Tour	
8	On/Off	Run Pre-Position Tour	
18	On/Off	AutoPivot Enable	
20	On/Off	Backlight Compensation (BLC)	
50	On/Off	Playback A, continuous	
51	On/Off	Playback A, single	
52	On/Off	Playback B, continuous	
53	On/Off	Playback B, single	
54	On/Off	IR mode	AUX ON sets IR to Auto. AUX OFF sets IR to OFF. Available for AUTODOME IP 5000i IR only.
57	On/Off	Night mode IR Filter In/Out	
60	On/Off	On-Screen Display (OSD)	
67	On/Off	Focus adjust for external IR Illuminators	
80	On/Off	Digital Zoom lock	
88	On/Off	Proportional Speed	
94	On/-	Recalibrate Azimuth Compass	
95	On/Off	Azimuth/Elevation Display	
96	On/Off	Compass Points Display	
100	On/Off	Record Tour A	
101	On/Off	Record Tour B	
149	On/Off	Turbo Mode toggle	
700	On/Off	Proportional speed control adjustment	Aux On, entered repeatedly, cycles through increasing speeds Super Slow, Slow, Medium, and Fast. Aux Off, decreases speeds through the same settings.
804	On/Off	Mask Calibration Procedure	
1-256	Set/-	Pre-position Programming	
1-256	-/Shot	Pre-position Recall	

## 12 Troubleshooting

### Table of Troubleshooting Issues

The table below identifies issues that could occur with the camera, and how to resolve them.

**Note:** Refer to the Error Codes section of the manual for descriptions of the error codes that appear on the OSD. The section also lists recommended actions to resolve the error codes.

Problem	Questions to Ask/Actions to Resolve the Problem
No camera control.	<ul style="list-style-type: none"> <li>- Ensure that the LAN cable has good connection and is secured.</li> <li>- Refresh the browser and ensure that video is updated.</li> <li>- Cycle the camera's power off and on.</li> </ul>
Video is noisy or distorted.	<ul style="list-style-type: none"> <li>- Check the integrity of all connectors and splices of the Ethernet cable.</li> </ul> <p>If O.K., then:</p> <ul style="list-style-type: none"> <li>- Contact Bosch Technical Support.</li> </ul>
Camera moves when attempting to move other cameras.	<ul style="list-style-type: none"> <li>- Check that the camera's IP address is properly set.</li> </ul> <p>If camera's IP address is not set, then:</p> <ul style="list-style-type: none"> <li>- Use Configuration Manager to confirm that two cameras do not have the same IP address. If they do, change the address of one of the cameras.</li> </ul>
No network connection.	<ul style="list-style-type: none"> <li>- Check all network connections.</li> <li>- Ensure that the maximum distance between any two Ethernet connections is 100 m (328 ft) or less.</li> </ul> <p>If O.K., then:</p> <ul style="list-style-type: none"> <li>- If you are behind a firewall, ensure that the Video Transmission mode is set to UDP.</li> </ul>
Camera reboots frequently or intermittently.	<p>Test your camera with another power supply.</p> <p>Check the Bosch website for a software update that might address the issue.</p>
No OSD messages appear.	<p>Bosch's Video SDK is required. Video management software from third parties does not use the SDK.</p>
The image on the screen is dim.	<p>Is the bubble dirty? If so, clean the bubble with a soft, clean cloth.</p>
The contrast on the screen is too weak.	<p>Adjust the contrast feature of the monitor. Is the camera exposed to strong light? If so, reposition the camera.</p>
The image on the screen flickers.	<p>Does the camera face directly into the sun or fluorescent lighting? If so, reposition the camera.</p>
No video.	<ul style="list-style-type: none"> <li>- Check that the mains power to the power supply is on.</li> <li>- Check to see if you have a web page.</li> </ul> <p>If you do, then try cycling the camera's power off and on. If you do not, then you may have the wrong IP address. Use Configuration Manager to identify the correct IP address.</p> <p>If O.K., then:</p> <ul style="list-style-type: none"> <li>- Check that there is 24 V output from the transformer.</li> </ul>

Problem	Questions to Ask/Actions to Resolve the Problem
	If O.K., then: - Check the integrity of all wires and mating connectors to the camera.
Picture is dark.	- Check that the Gain Control is set to High. If O.K., then: - Check that the Auto Iris Level is set to the appropriate level. If O.K., then: Ensure that the maximum distance between any two Ethernet connections is 100 m (328 ft) or less. If O.K., then: - Restore all camera settings.
Background is too bright to see subject.	Turn on backlight compensation.
Configuration or video management software identifies the unit as "Videojet Generic".	The model ID may be corrupt. Complete the steps in the section <i>Rebooting the unit</i> , page 66.

## 12.1

### Rebooting the unit

#### Reboot the unit

After a Factory Default or firmware update, reboot the unit if:

- You cannot connect to the unit in the Web browser.

OR

- Configuration Manager or BVMS or similar software identifies the unit as "Videojet Generic".
  - ▶ Reboot the unit using one of the following methods:
- In the web browser, type the IP address and then */reset* (without any punctuation). Press the **Enter** key.

OR

- In Configuration Manager, right-click the IP address and click **Restart**.
  - ▶ Wait two minutes for the process to complete.

If you cannot control the unit after the firmware upgrade, then cycle the power to the unit. If a power reset does not solve the problem, or if Configuration or video management software identifies the unit as "Videojet Generic," then contact your Bosch Service Center for an RMA for the unit.

## 12.2 Physical reset button

Each camera has a hardware reset button. You may need to press the reset button to reset the camera to factory defaults if you encounter the following circumstances:

- You can power up the camera but cannot log on to the camera using the web browser.
- The camera doesn't start up, or fails to power up via PoE.
- The camera cannot search an IP address.
- The camera's firmware crashed.
- You forgot the password to access the camera.
- The image becomes frozen.
- You cannot update the firmware.
- The camera disconnects from the network at random and needs a reboot.
- The camera no longer finds pre-positions (preset positions).
- You cannot configure the camera using the web browser.
- The camera has no video out.

### Steps to complete a hardware reset for all camera models

1. Apply power to the camera. Search for the IP address, and then log on to the camera using the web browser. (**Note:** You can use Configuration Manager to identify the IP address.)
2. Find the hardware reset button on the camera block. (See each section below to locate the reset button for your camera model.)
3. Push and hold the reset button for more than 8 seconds. The red LED indicator on the PCBA board will come on to show that the hardware reset started.
4. Let the camera complete a self-check. When the self-check completes, the red LED will go off.
5. Search again for the IP address. Access the camera using the web browser. Set the initial password for the camera.

For AUTODOME IP 5000i IR | AUTODOME IP starlight 5000i IR models, the reset button is near the SD card slot. To access the reset button, remove the metal cover installed on the back of the camera.

1	Reset button	2	SD card slot
---	--------------	---	--------------

## 12.3 Customer Service and Support

If this unit needs service, contact the nearest Bosch Security Systems Service Center for authorization to return and shipping instructions.
